Distributor

We provide overall Newton system and solution services from on-site investigation, project diagnosis, solution design, intelligent manufacturing of whole system products, implementation, and operation monitoring.

NEWTON STEAM AND HEAT SMART ENERGY SAVING SYSTEM

All-round and efficient automation

VMV Newton has advanced truss type 24 hour unmanned flexible manipulator machining center unit

- Department: Smart Manufacturing Product Workshop
- Highlights: Quality management construction, including intelligent cloud platform
- In the past few years, great progress has been made in terms of quality and efficiency. High precision and high requirements are always the first priority.
- The machine hand produces a product every two minutes, each accessory every minute.

Precision smart manufacturing process

3D modeling design

Solidworks 3D modeling based on fluid mechanics, thermodynamics, and mechanical principles Pipe Flow Expert software fluid design check CAXA software technology and CNC programming perfect combination.

Manufacturing of key precision internals

High-precision internal parts use micro-enlargement projection to monitor the whole process of manufacturing and inspection, high-precision laser welding machine, to ensure seamless welding of internal parts of different materials Imported machine tools produce precision parts and ensure product performance.

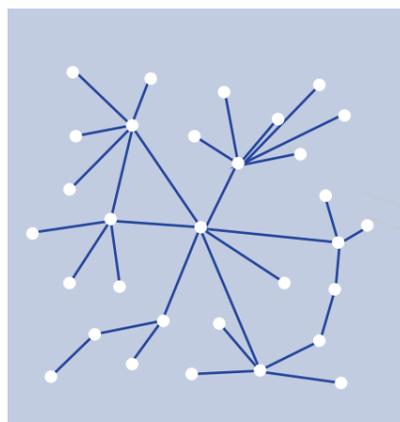

Precision CNC Intelligent Manufacturing

5-axis CNC machining center Multi-station machining of CNC lathes using rotary hydraulic chucks, oneperson multi-machine operation, efficient manufacturing

CNC intelligent control cloud platform

Intelligent manufacturing cloud platform and ERP system height Realizing offline production and cloud management, including technical management, production management, quality management, financial management, performance management and other functional closed-loop intelligent manufacturing, the online work of all employees, and the digitalization of enterprise management.

Fully automatic 5-axis machining center, NB-IOT intelligent manufacturing cloud platform, and self-supplied supply chain system are all ensuring the energy saving effect and safe application of Newton's products

Newton's steam laboratory uses different pressures of steam to do type tests on each new product, Verify the pressure reduction ratio, closing performance and KV value of the pressure reducing valve; Verify the displacement curve, back pressure rate, and air leakage rate of steam traps, air traps, and pneumatic traps; Verify the displacement curve and fatigue times of pump traps; Verify the efficiency of jet pumps. We must check each steam product to leave the factory after passing the simulated action test.

Condensate Flash Recovery System

Condensate Flash System

P122

K—Knowledge Provide professional knowledge of steam. Including steam properties, selection of pressure reducing valve, solutions of temperature & pressure reduction device, control system of pressure flow, process piping of steam pipeline, selection of trap, recovery of condensate, solutions of steam recovery etc.

C—Consulting System consultation diagnosis and design process plan. With the assistance of the user, have a detailed understanding of the production equipment, through on-site photography, recording detailed data, searching for process flow charts, and in-depth understanding of the current status of steam system piping, steam and condensate use, and finding out the existing problems of the system, according to the industrial energy-saving standard workbook compiled by VMV proposes optimization plans and formulates process plans.

P—Product Provide quality and reliable products.

Bellows sealed globe valve with safe, reliable and switch flexible.

Steam trap with high efficiency, energy saving and long life, pump traps for heat recovery, and condensate recovery devices.

Pressure reducing valve group and temperature & pressure reducing device with safe and reliable.

Steam distribution bundles and condensate manifold bundles with space and cost saving, easy to maintain.

Suitable for high-performance exhaust valves, air traps, drain valves, vacuum breakers, check valves, filters, silencer, mixers and other piping accessories under various working conditions.

S—Service Provide timely pre-sale and after-sale service. Establish a complete online and offline communication mechanism, so that every user can enjoy the technical services and technical support provided by VMV, and realize the concept of serving users.

Professional Terms

Saturated steam: refers to pure steam corresponding to the boiling point temperature of water under a certain pressure.

Superheated Steam: Steam with a temperature higher than saturated steam.

Absolute pressure and gauge pressure: Absolute pressure refers to the pressure in MPa relative to ideal vacuum; gauge pressure refers to the pressure in MPa relative to atmospheric pressure.

Example: 1 atmosphere equals 0.1013MPa absolute pressure. Gauge pressure plus 0.1013MPa equals absolute pressure.

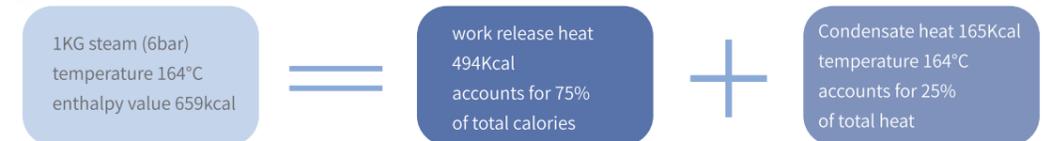

Steam pressure/temperature: The pressure of saturated steam corresponds to the saturation temperature.

Example: The saturation temperature corresponding to the gauge pressure of saturated steam of 2 bar is 133.56°C.

Sensible heat of saturated water: The heat required to heat 1kg of water from 0°C to the boiling point under a certain pressure, and the unit of heat is kJ.

Latent heat or heat of evaporation: Under a certain pressure, the heat required to heat 1 kg of water into steam of the same pressure is called the heat of evaporation. On the contrary, the heat released by cooling 1 kg of steam of a certain pressure into condensed water of the same pressure is called latent heat. The unit of heat is kJ.

Total heat of steam: latent heat of steam + sensible heat of condensed water is the total heat of steam, that is, all heat above zero under a certain pressure.

Measures for Efficient Utilization of Steam Thermal Energy

- Use superheated steam for steam delivery as much as possible.
- Reduce steam pressure and increase steam latent heat through pressure reducing valve Set or temperature & pressure reduction device.
- Improve the steam utilization rate, do a good job of heat preservation, reasonably select different types and different displacement traps, and use high-quality steam traps to prevent leakage.
- Recover the heat of the condensed water and make full use of the sensible heat of the condensed water. Use flash tank to extract low-pressure steam, back pressure to recover condensate, pump trap to recover condensate, electric pump to recover condensate, flash steam, heat exchanger to extract heat energy, etc.
- Recovery of spent steam through direct and indirect heat exchangers and heat pump suction.
- Use multi-stage heating to improve equipment steam utilization, such as double-effect, multi-effect concentration; multi-stage air preheating heating coil.
- Attach great importance to the removal of non-condensable gases from pipes and equipment.
- Reasonable piping to prevent steam airlock.

Properties of Steam

Professional Terms

Nominal diameter DN: It is the size expressed by a number that is common to all accessories in the piping system. The parts identified by thread or outer diameter have been distinguished. The nominal diameter is a convenient original integer for reference.

Nominal pressure PN: It is a pressure-related identification code expressed in numbers, and is a convenient original integer for reference.

Working pressure PO: Valve pressure at the applicable medium temperature.

Maximum operating pressure PMO: Under correct operating conditions, the maximum pressure at the inlet end of the trap.

Maximum allowable pressure PMA: At a given temperature, the maximum pressure that the trap casing can withstand permanently.

Minimum operating pressure POM: Min. operating pressure Under correct operating conditions, the minimum pressure at the inlet end of the trap.

Working back pressure: It is the pressure at the outlet end of the steam trap under working conditions.

Maximum working back pressure: It is the maximum pressure at the outlet end of the steam trap when it can operate correctly under the maximum working pressure.

Back pressure rate: The percentage of working back pressure and working pressure.

Working pressure difference: The difference between the working pressure and the working back pressure .

Maximum working pressure difference: between the maximum working pressure and the maximum working back pressure of Max operating different pressure.

Operating temperature TO: valve temperature in the applicable medium.

Maximum operating temperature TMO: The maximum temperature that the medium is allowed to use under the specified pressure.

Maximum allowable temperature TMA: The maximum temperature that the trap casing can withstand permanently under a given pressure.

Sub cooled temperature: The absolute value of the difference between the condensate temperature and the saturation temperature at the corresponding pressure.

Cold condensate capacity quantity QC: The steam trap can drain maximum weight of condensate within one hour at a given differential pressure and 20°C .

Hot condensate capacity QH: The maximum weight of condensate that the steam trap can discharge within one hour at a given pressure difference and temperature.

Steam loss quantity QL: The amount of fresh steam leaking from the steam trap per unit time.

No load steam loss quantity QNL: The quantity of leaked steam under the condition of fully saturated steam before the steam trap.

Loads steam loss quantity QLL: The steam leakage quantity of the steam trap under a given load rate.

Thermostatic (film box) steam trap

Thermostatic (film box) steam trap

Film box steam traps are widely used in heat tracing pipelines and equipment with small displacement and low temperature requirements due to their small size, large subcooling degree, good energy saving effect and low temperature resistance.

The technical advantages of VMV steam traps are unique and reasonable structure and high-precision internal parts.

High Corrosion Resistance

Stainless steel SS304 has beautiful appearance and good performance.

Integrated Filtration Design

Effectively prevent pipeline impurities from entering the valve to ensure the proper operation of the steam trap.

Suitable For Clean Pipes

All internal parts are made of stainless steel SS304, suitable for food, medicine and other industries.

Large Subcooling Film Box Module

The subcooling degree of the Thermostatic (film box) steam trap is 15°C to remove the condensed water below the saturation temperature, and the energy saving is effective.

Structural Features

VMV Film box steam trap body and bonnet are made of 304, which can be used in the clean environment, such as medical, health, food and other industries. The Film box is made of stainless steel, and the condensate discharge temperature is subcooled at 15-20°C. The Film box steam trap adopts linear sealing closing system, which has no noise, good air exhausting capacity, fully utilizes the sensible heat of condensed water, and has good energy saving effect. Film box steam traps work on the difference in temperature between steam and condensate. When the steam in the pipe releases heat and the temperature decreases to produce a vacuum, the diaphragm in the diaphragm box shrinks and moves to open the valve seat to discharge condensate. The Film box steam trap can be used as a vent valve.

Steam Trap Election and Installation

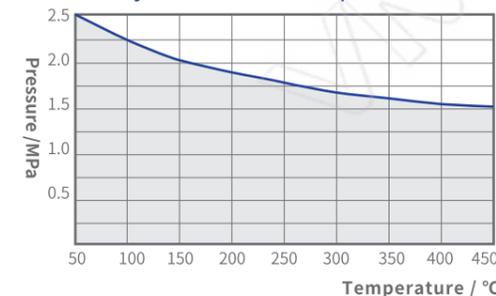

Film box steam trap drains intermittently. The normal product SKT16 discharges subcooling at 15-20°C. If there is a subcooling requirement, please specify it when ordering. The back pressure rate of the Film box steam trap can reach 50% (rear end pipe pressure/steam pressure), which is not suitable for closed recovery system, but suitable for pipeline and heat tracing system to remove condensate. In general, the safety factor is 2-3 times.

Special reminder: The amount of condensed water and the differential pressure of the steam-using equipment are important indicators for the selection. The same type of steam trap will increase the displacement with the increase of the differential pressure. See the details on displacement curve. Please do not mistakenly think that the large diameter of the steam trap with large displacement.

Temperature Adjustment Table

Thermodynamic (Disc) Steam Trap

Thermodynamic (Disc) Steam Trap

Thermodynamic steam traps are widely used in low, medium and high pressure steam pipelines, process heat tracing, and small displacement equipment due to their small size, large displacement, energy saving, long life, and low temperature resistance.

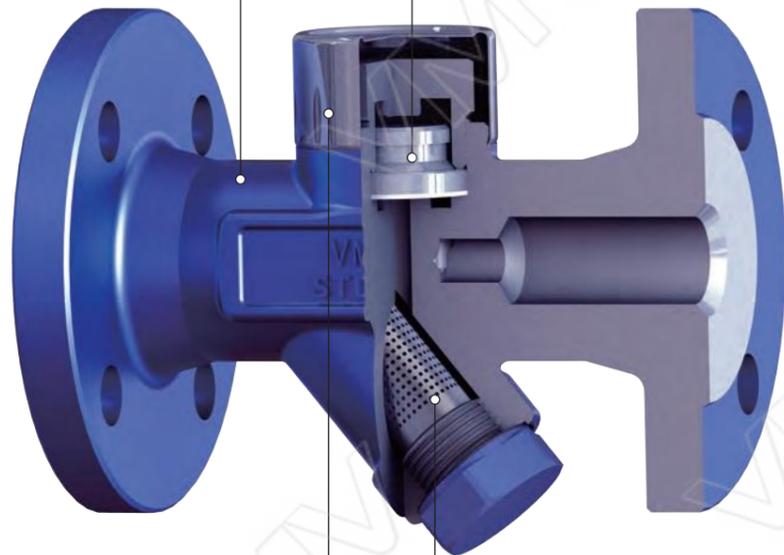

The technical advantages of VMV steam traps are unique and reasonable structure, high-precision internal parts, changeable valve seat.

High Corrosion Resistance

A105 (15CrMo) material is used, and corrosion allowance, minimum shell wall thickness, pressure and temperature grade are fully considered in the design.

Unique Seat and Disc

The seat and plate are made of martensitic stainless steel with unique heat treatment. According to different working conditions, two kinds of condensate removal solutions of low temperature (less flash steam) and saturated water can be provided

Stainless Steel Insulation Cover

Stainless steel thermal insulation cover ensures that the transformer room is not affected by the outdoor environment and prevents invalid actions.

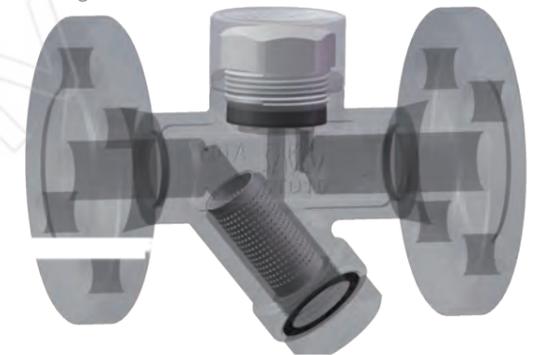

Built-in Filter

Effectively prevent pipeline impurities from entering the valve, make sure the steam trap is working properly.

Structural Features

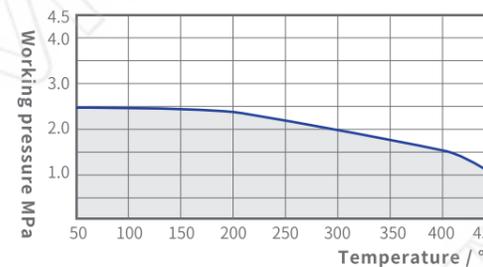

VMV thermodynamic steam trap uses A105 for the low pressure trap body and 15CrMo for the medium pressure steam trap body. According to the Bernoulli equation, it has been repeatedly calculated and finally finalized through a large number of experiments. The product is available in low temperature and saturated versions. The low-temperature type discharges the condensate at a lower temperature (higher degree of subcooling) and has less noise, but the air discharge capacity is poor; the saturated type discharges the condensed water close to the saturation temperature (low degree of subcooling), with high noise and good air discharge capacity. Thermodynamic steam traps operate on the difference in flow rates between steam and condensate. When the condensate passes through the valve seat, the flow rate is small, and the valve plate is opened to discharge the condensate water; when the steam enters the valve seat, the valve seat is closed due to the large flow rate.

VMV Newton has broken through the problems that thermodynamic steam traps are not energy-saving, noisy, and discharges raw steam, and has become the best steam pipe guide steam trap. Its advantages are small size, long life, reliable action, convenient maintenance, and low noise (Low temperature type) no original steam leakage

Thermodynamic Trap Selection and Installation

The thermodynamic steam trap is intermittently drained, and the normal product STD16/STD42 steam trap has a subcooling degree of 5-10°C. The back pressure rate of the thermodynamic steam trap can reach 80% (rear pipe pressure/steam pressure), and it is suitable for pipes and small equipment to remove condensate. In general, the safety factor is 2-3 times.

Special reminder: The amount of condensate and the differential pressure of the steam-using equipment are important indicators for selection. The same type of trap will increase the capacity with the increase of the differential pressure. See the details on capacity curve. Please do not mistakenly think that the large diameter of the trap with large displacement.

Thermodynamic steam traps can be installed arbitrarily at the bottom of the pipeline or equipment. The basic configuration of the steam traps is shown in the figure above.

Thermodynamic (Disc) Steam Trap

STD01 Thermodynamic (Disc) Steam Trap

Thermodynamic (Disc) Steam Trap STD16

Working Principle

- Depends on the difference of steam and liquid flow rate
- Exclude saturated condensate

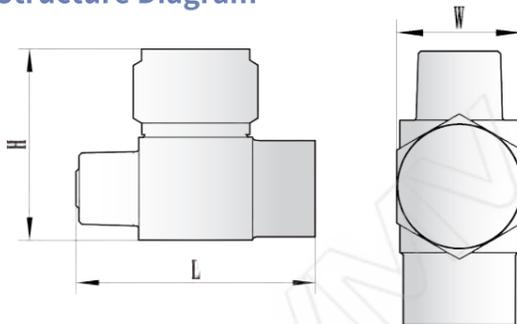

Features

- The body and bonnet are all made of stainless steel. Through heat treatment and aging treatment, they are not denatured and wear-resistant under high temperature and high pressure, which improves the service life of the trap.
- The fluid channel of the internal structure is designed strictly according to Bernoulli's equation, and the structure is reasonable.
- The back pressure rate is as high as 80% or more.

Material List

- Bonnet:** 304
Body: Martensitic Stainless Steel
Disc: Martensitic Stainless Steel

STD01 Capacity Chart

Working Principle

- Depends on the difference of steam and liquid flow rate
- Exclude saturated condensate

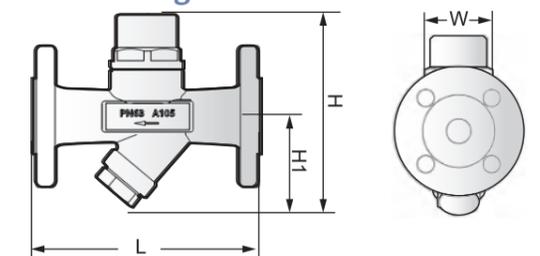

Features

- The body and cover are all made of forged steel.
- The disc and seat are made of martensitic stainless steel. After heat treatment and aging treatment, they are not denatured and wear-resistant under high temperature and high pressure, which improves the service life of the trap.
- Stainless steel insulation cover to isolate and slow down heat loss and eliminate invalid actions.
- The fluid channel of the internal structure is designed strictly according to Bernoulli's equation, and the structure is reasonable.
- Built-in filter makes the trap work in a clean environment.
- The back pressure rate is as high as 80% or more.
- To exclude low temperature traps with large subcooling degree, it needs to be customized.

Inverted Bucket Steam Trap

Inverted Bucket Steam Trap

Inverted bucket Steam traps are widely used in steam transmission pipelines, process heat tracing, jacketed heating kettles tank, reboilers and other equipment due to their safety, reliability, energy saving, long life, low temperature resistance and other characteristics.

The technical advantages of VMV steam traps: Unique and reasonable structure, high-precision internal parts

High Corrosion Resistance

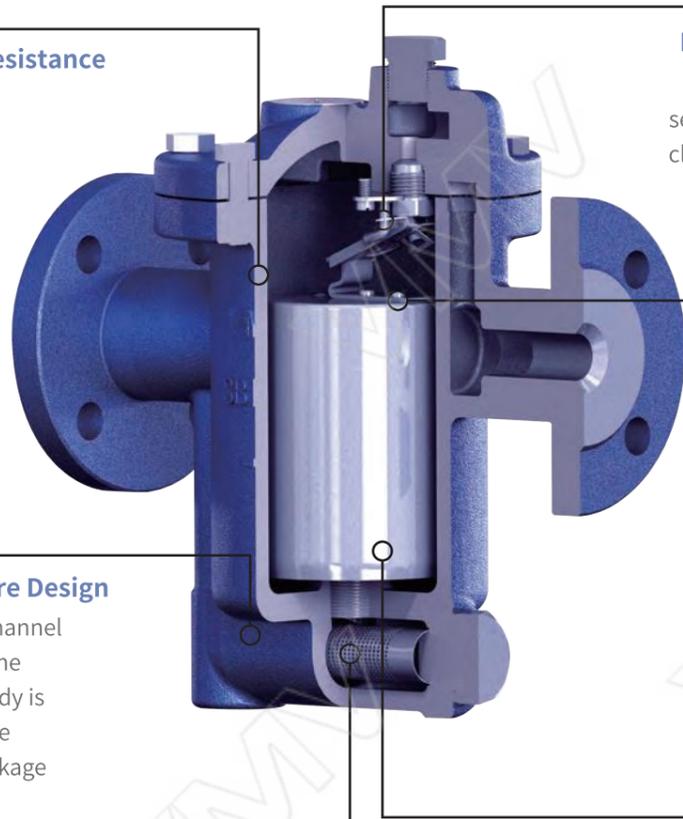

Using WCB material
Design with full consideration of corrosion allowance, Minimum shell wall thickness, pressure and temperature class

Leak-free Structure Design

The U-shaped flow channel design ensures that the inside of the valve body is in a water-sealed state
No original steam leakage

Built-in Filter

Effectively prevent pipeline impurities from entering the valve Make sure the steam trap is working properly

Flexible Closing System

Micron-level high-precision seat and core ensure reliable closing system and no steam leakage

Stainless Steel Bucket Exhaust Structure

Small holes are left on the upper part of the bucket to remove air and other non-condensable gases to prevent the occurrence of steam lock the steam trap

Built-in Check Valve

Prevents water hammer from damaging internals. Also suitable for superheated steam environments

Structural Features

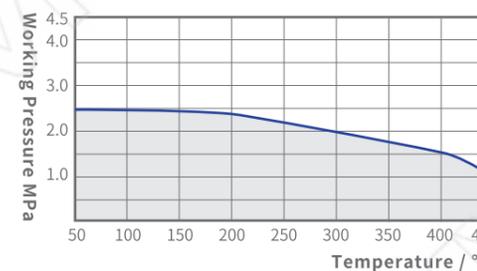

VMV steam trap design has fully considered factors such as shell strength, pressure and temperature grade, casting manufacturability, tightness of valve plug and seat closure, impact caused by water and vapor mixing, and the strength of valve cover gasket is affected by low temperature environment and other factors .

Inverted bucket steam traps work on the difference in density between steam and condensate. When the bucket is full of condensed water and non-condensable gas, the exhaust hole on the upper part of the bucket removes the non-condensable gas, the bucket loses buoyancy and drives the valve core to move down, the trap opens to drain, and when steam enters the bucket after draining, the bucket floats to drive the valve The core closes the trap.

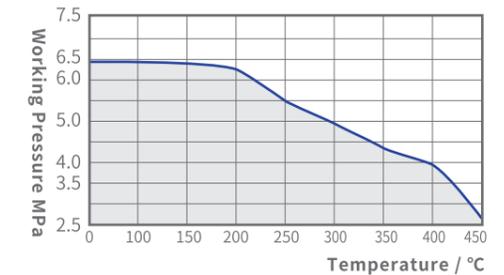

The great advantages of the inverted bucket trap are high back pressure rate, long life, reliable action, convenient maintenance and no original steam leakage.

WCB/A105 Material PN63 Valve Body Pressure-Temperature Ratings

Selection and Installation of Inverted Bucket Steam Traps

The inverted bucket steam trap is intermittently drained, the subcooling degree is 5-10°C, and the back pressure rate is over 85% (back-end pipeline pressure/steam pressure). In general, the safety factor is 2-3 times when selecting, and 5-8 times for air separation units and drying cylinders. The amount of condensed water and the differential pressure of the steam-using equipment are important indicators for model selection. For the same type of steam trap, the displacement increases with the increase of the differential pressure. See the details on displacement curve.

Special reminder: Please do not mistakenly think that a trap with a large diameter has a large displacement.

The inverted bucket trap is installed horizontally at the bottom of the pipeline or equipment. The basic configuration of the trap is shown in the figure above.

When the pipeline is superheated steam, a check valve must be installed to prevent the failure of the trap due to the superheated steam drying out the water seal in the trap.

Working Principle

- Relying on the difference in vapor and liquid density.

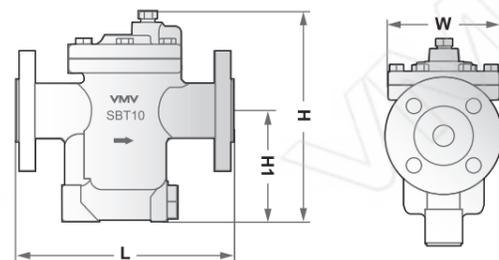

Features

- The body and cover are all made of forged steel/cast steel.
- Internal parts are all made of stainless steel and added with anti-wear allowance, extend trap life.
- U-shaped flow channel design, to achieve water sealing effect, no leakage of steam.
- Reliable flexible closure system with patented technology, no steam leakage.
- Install anti-water hammer device.
- Built-in check valve, suitable for superheated steam environment.
- Built-in filter allows the steam trap to work in a clean environment.
- Select different displacement curves according to the pressure difference to increase the displacement.
- The back pressure rate is as high as 90% or more.
- After the steam is stopped, the condensed water can be removed by opening the screw plug to prevent damage to the steam trap due to low temperature freezing.

Pilot Inverted Bucket Steam Trap

Pilot Inverted Bucket Steam Trap

The pilot inverted bucket steam trap has the characteristics of large displacement, long life, good energy saving effect, water hammer resistance, and beautiful appearance. It is widely used in process heat tracing, jacketed heating kettles tank, reboilers and other equipment.

The technical advantages of VMV traps are: unique and reasonable structure, high-precision internal parts.

High Corrosion Resistance

Using WCB material
Fully consider corrosion allowance, minimum shell wall thickness, pressure and temperature grade when designing

Flexible Pilot Closure System

High-precision flexible pilot closing system Pilot valve guides the main valve to open and close

Stainless Steel Bucket Exhaust Structure

Small holes are left on the upper part of the bucket to remove air and other non-condensable gases to prevent the occurrence of steam lock the valve

Built-in Check Valve

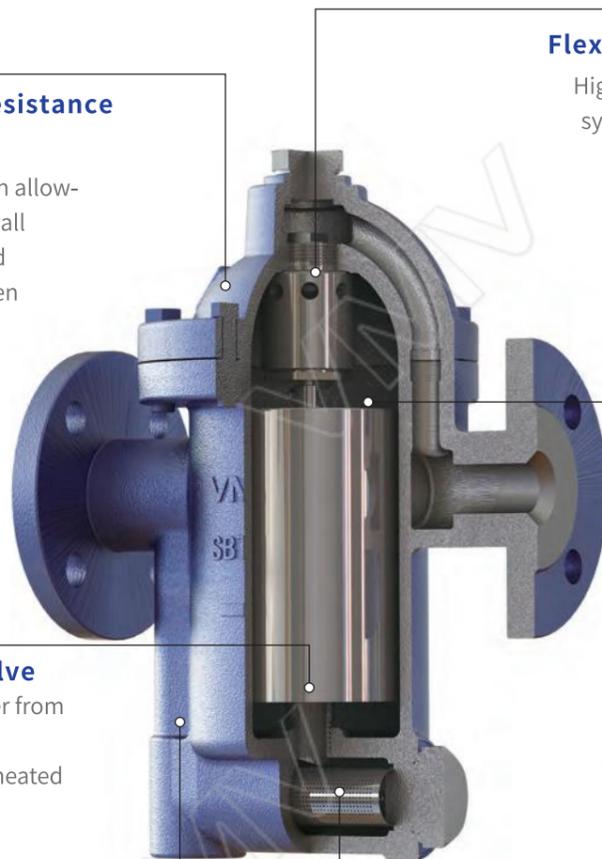

Prevents water hammer from damaging internals
Also suitable for superheated steam environment

Built-in Filter

Effectively prevent pipeline impurities from entering the valve
Make sure the trap valve is working properly

Leak-free Structure Design

The U-shaped flow channel design ensures that the inside of the valve body is in a water-sealed state
No raw steam leakage

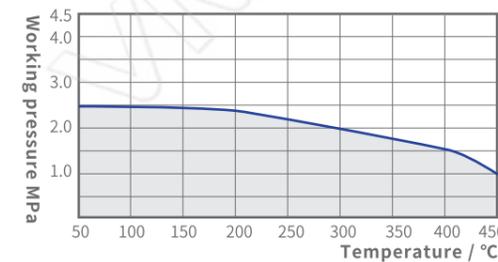

Structural features

In the design of VMV steam trap, take full account of the strength of the shell, the pressure and temperature grade, the manufacturability of casting, the tightness of the valve core and seat closure, the impact caused by the mixing of water and steam, and the strength of the valve cover gasket are affected by the low temperature environment, etc. Pilot inverted bucket steam traps work on the difference in density between steam and condensate. When the bucket is full of condensed water and non-condensable gas, the exhaust hole on the upper part of the bucket removes the non-condensable gas, the bucket loses buoyancy and drives the pilot valve core to move down to the bottom dead position, guiding the main valve to open, and steam enters the bucket after the trap is drained, the bucket floats to drive the pilot valve and the main valve to move up to close the trap. The biggest advantages of pilot inverted bucket traps are small size, large capacity, high back pressure rate, long life, reliable action, convenient maintenance, and no original steam leakage.

Selection and Installation of Pilot Inverted Bucket Steam Traps

The pilot inverted bucket steam trap is intermittently drained, with a subcooling degree of 5-10°C and a back pressure rate of more than 85% (back-end pipeline pressure/steam pressure). In general, the safety factor is 2-3 times when selecting, and 5-8 times for air separation units and drying cylinders.

The amount of condensed water and the differential pressure of the steam-using equipment are important indicators for model selection. For the same type of steam trap, the displacement increases with the increase of the differential pressure. See the details on displacement curve. Special reminder: Please do not mistakenly think that a trap with a large diameter has a large displacement. The pilot inverted bucket trap is installed horizontally at the bottom of the pipeline or equipment. The basic configuration of the trap is shown in the figure on the right.

In order to prevent the water hammer phenomenon after the water vapor in the pipeline is mixed, a check valve must be built in.

SBT60 Pilot Inverted Bucket Steam Trap

Pilot Inverted Bucket Steam Trap SBT63

Working Principle

•Relying on the difference of vapor and liquid density, the main valve is guided to open through the pilot valve, and the displacement is large.

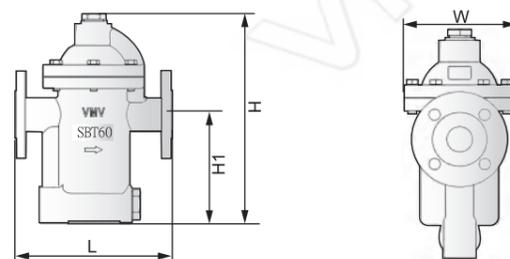

Features

- The body and cover are made of cast steel.
- The internal parts are all made of stainless steel, and the wear allowance has been fully considered in the design of the movable parts, which improves the service life of the steamtrap.
- U-shaped runner design achieves water sealing effect without leakage of steam.
- Flexible closing system with patented technology, no steam leakage.
- Install anti-water shock device, so that the fluid entering the valve body does not produce water hammer phenomenon.
- Built-in check valve, suitable for superheated steam environment.
- Built-in filter allows the steam trap to work in a clean environment.
- Select different displacement curves according to the pressure.
- The back pressure rate is as high as 90% or more.
- After stopping, the screw plug can be opened to drain the condensed water to prevent damage to the trap due to low temperature freezing.

Lever Ball Float Steam Trap

Lever Ball Float Steam Trap

The lever ball float steam trap has the characteristics of large displacement, long life, good energy saving effect, water hammer resistance, beautiful appearance, etc. It is widely used in process heat tracing, jacketed heating kettles tank, reboilers and other equipment.

The technical advantages of VMV steam traps are: unique and reasonable structure, high-precision internal parts.

High Corrosion Resistance

Using WCB material
Fully consider corrosion allowance, minimum shell wall thickness, pressure and temperature grade when designing

Unique Exhaust Air Valve

The unique air exhaust valve makes the trap no air blocking phenomenon caused by air and other non-condensable gases during initial or normal operation.

Flexible Closing System

Unique flexible closing mechanism
No rigid impact to ensure long life
Micron-level high-precision valve seat. The valve core ensures reliable and tight closing

Built-in Filter

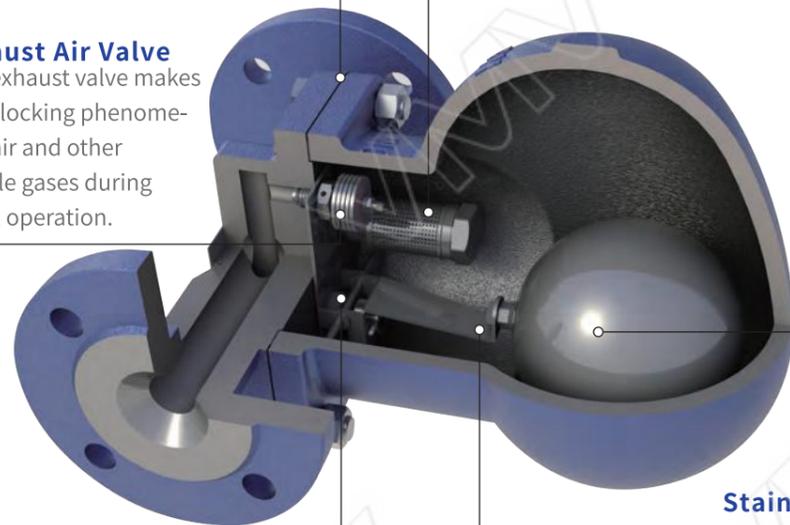

Effectively prevent pipeline impurities from entering the valve
Keeps traps working properly while preventing water hammer from damaging internal components

Stainless Steel Float

Defect-free laser-welded float ensures long service life of the trap

Unique Float Assembly

Precisely calculated structure of the floating ball assembly enables the closing system to work in a water-sealed state without steam leakage

Structural Features

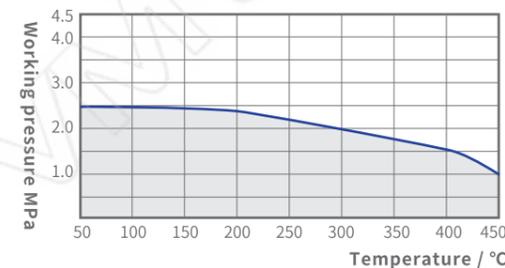

The flexible closing system is applied to the lever ball float trap, which solves the problems of short life and lax closing. In the design, the strength of the shell, the pressure and temperature grade, the manufacturability of casting, the impact caused by the fluid flow channel and the water-vapor mixing are considered, and the closed system works in a water-sealed state.

Lever ball float steam trap works on the difference in density between steam and condensate. When the valve body is filled with condensed water and non-condensable gas, the air exhaust valve is opened to remove the non-condensable gas, the floating ball moves up to drive the valve core to open, and after the condensate is drained, the floating ball drives the valve core to move down and closes the trap.

The biggest advantage of lever ball float trap is high back pressure rate (differential pressure 0.01bar can work), long life, reliable action, easy maintenance and no original steam

WCB/A105 Material PN25

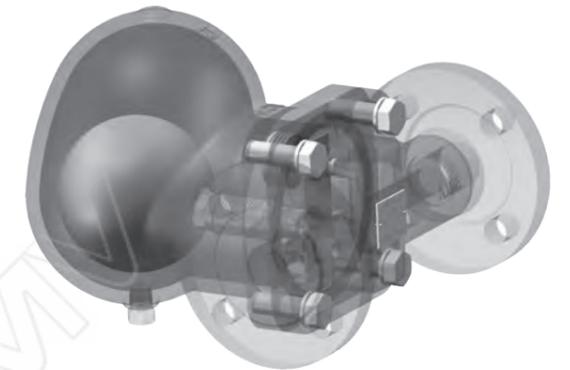

Valve Body Pressure-Temperature Ratings

Lever Ball Float Trap

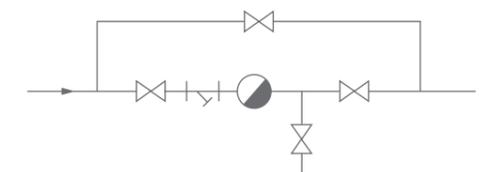

The lever ball float type steam trap is for continuous drainage, the subcooling degree is about 5°C, and the back pressure rate is over 95% (back-end pipeline pressure/steam pressure). In general, the safety factor is 2-3 times when selecting, and 5-8 times for air separation units and drying cylinders. Condensate volume and differential pressure of steam-using equipment are important indicators for model selection. The same type of trap increases with the increase of pressure difference and displacement. See the details on displacement curve.

Special reminder: Please do not mistakenly think that a trap with a large diameter has a large displacement. The lever ball float trap is installed horizontally at the bottom of the pipeline or equipment, and the SFT10 trap can be installed horizontally or vertically. The basic configuration is shown in the figure on the right.

The lever ball float type steam trap is made of ASTM216 WCB/WC6 /CF8/ CF8M stainless steel, some bonnets are made of ASTM A105/F304/F316, the inner parts are made of stainless steel, and there is a built-in filter device.

- Nominal pressure: PN25;
- Max allowable temperature: 425°C;
- Max working pressure: 1.6MPa /2.0MPa /3.2MPa /4.5MPa/6.5MPa;
- Max operating temperature: 400°C;
- Connection type: threaded RC or flange (GB/T9124.1-2019; HG/T20615-2009; HG/T20592-2009, etc.)

Lever ball float traps are best suited for back pressure recovery of condensate.

Lever Ball Float Proportional Regulating Steam Trap

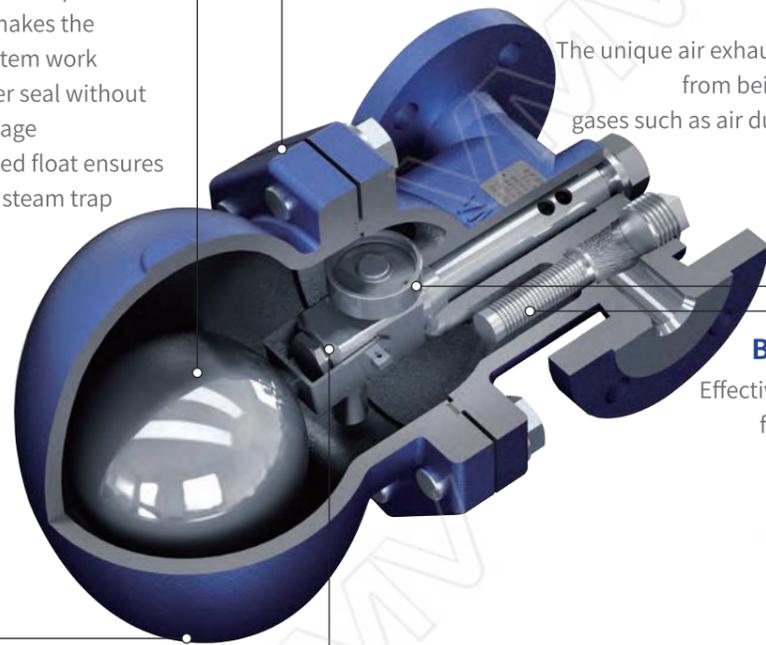

Lever Ball Float Proportional Regulating Steam Trap

Lever ball float proportional regulating steam trap is characterized by change according to condensate discharge rate large proportional displacement, long life, good energy-saving effects, water hammer resistance, and beautiful appearance. It is widely used in process heat tracing, jacket heating kettles, reboilers and other equipment.

The technical advantages of VMV steam traps are: unique and reasonable structure and high-precision internals!

Unique Float Assembly

Precisely calculated floating ball component structure makes the closing system work under water seal without steam leakage. Laser welded float ensures long life of steam trap.

High Corrosion Resistance

Using WCB material, full consideration of corrosion allowance, minimum shell wall thickness, pressure and temperature rating.

Unique Exhaust Valve

The unique air exhaust valve prevents the steam trap from being blocked by non-condensable gases such as air during initial or normal operation.

Built-in Filtering Device

Effectively prevents pipeline impurities from entering the valve to ensure the proper operation of the trap.

Precise and Reliable Controller

The controller adopts a rotating shaft structure, long life without rigid impact. Valve core ensures the reliability of the closing system and no steam leakage.

Reserved the sewage outlet to regularly discharge the dirt

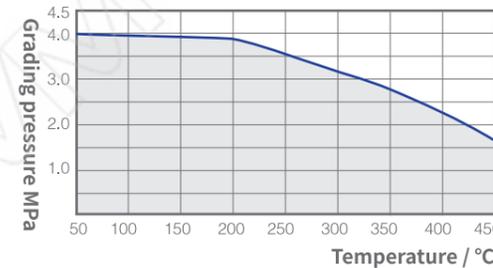

Structural Features

VMV applied the rotary shaft controller to lever ball float proportional regulating steam trap, which solved the problems of short life and lax closing. In the design, factors such as shell strength, pressure and temperature grade, casting process-ability, fluid flow path, impact caused by water and vapor mixing, losing the secondary water seal valve, the strength of the cover pad affected by low temperature environment and other factors are fully considered.

Lever ball float proportional regulating steam trap relies on the density difference between steam and condensate to work. When the valve body is full of condensed water and non-condensable gas, the air exhaust valve is opened to remove the non-condensable gas, proportional enlarged valve seat hole until it is fully opened, and the floating ball moves up to drive the controller spool rotation. After draining the condensed water, the floating ball drives the controller spool to rotate and adjust the size of the valve seat hole until closing.

WCB/A105 Material PN40

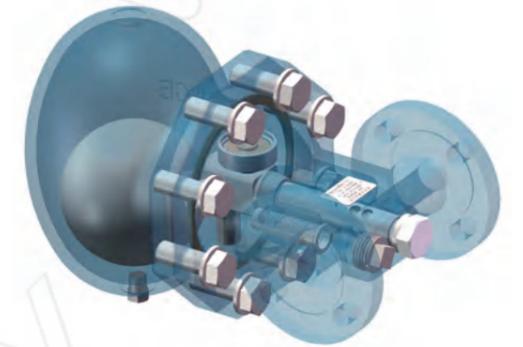

Valve Body Pressure - Rating Temperature

Lever Ball Float Proportional Regulating Steam Trap Selection and Installation

The lever ball float steam trap can drain water continuously. The subcooling degree is about 5°C, and the back pressure rate is above 95% (back-end pipeline pressure/steam pressure). It is suitable for pipelines and small equipment to remove condensate and back pressure to recover condensate. Generally, the safety factor is 2-3 times when selecting models, and 5-8 times for air separation units and drying cylinders. The condensed water volume and pressure difference of steam equipment are important indicators for type selection. The displacement of the same type of trap increases with the increase of pressure difference. Check the displacement curve in detail.

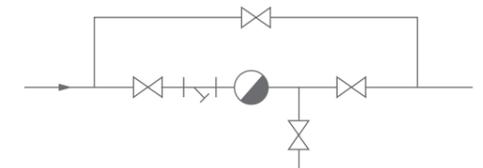

Notice: Please don't mistake it for a large-diameter steam trap with a large displacement.

The biggest advantage of lever ball float proportional regulating steam trap is suitable for a variety of displacement variables from small to large working environment, in addition to high back pressure rate (it can work under the pressure difference of 0.01bar), long life, reliable operation, convenient maintenance, with no original steam leakage.

The lever ball float proportional regulating steam trap is made of ASTM216 WCB cast steel, part of the valve cover is made of ASTM A105, the internals are made of stainless steel, with built-in filter.

- Nominal pressure: PN40;
- Max allowable temperature: 425°C;
- Max working pressure: 3.2MPa;
- Max working temperature: 350°C;
- Connection method: threaded RC or flange (GB/T9115.1-2000; HG/T20615-2009; HG/T20592-2009, etc.)

The lever ball float proportional regulating steam trap is installed horizontally at the bottom of the pipeline or equipment. The basic configuration is shown on the graph.

The lever ball float proportional regulating steam trap is most suitable for back pressure recovery of condensate.

Lever Ball Float Steam Trap

Lever Ball Float Steam Trap

SFT10 Lever Ball Float Steam Trap

Lever Float Steam Trap

SFT70 Lever Float Steam Trap

Lever Float Steam Trap SFT80

Working Principle

- Based on the density of vapor and liquid.

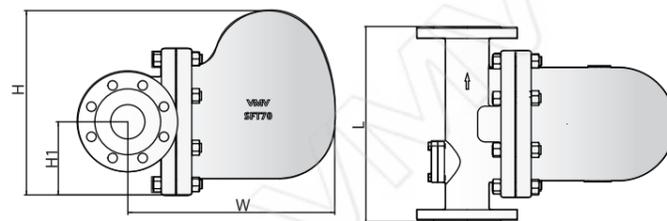

Features

- The body and bonnet are made of cast steel/forged steel.
- All internal parts are made of stainless steel, and the wear allowance has been fully considered in the design of movable parts, which improves the service life of the trap.
- Special flow channel design achieves zero water hammer.
- Double balanced seat for long service life.
- Built-in air exhaust valve to prevent steam lock.
- Water seal design, no original steam leakage.
- Choose different displacement curves according to the pressure.
- The back pressure rate is as high as 95% .

Technical Standard

- GB/T12250-2005 Steam Traps Terminology Marking Structure Length
- GB/T22654-2008 Technical Conditions for Steam Traps
- GB/T12251-2005 Test Method for Steam Traps
- ISO 6948 Automatic steam traps Production and performance characteristic tests

Automatic Level Control Device for Vapour-Liquid Two-Phase Flow Trap QYL

Working Principle

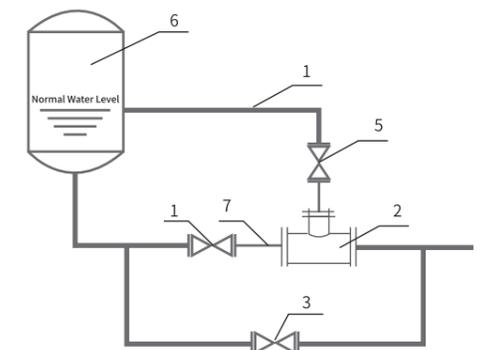

After the drainage flows through the specially designed front-end valve core and is blocked, it enters the valve chamber. The liquid level in the container slowly rises to the interface of the phase change tube, and the phase change tube changes from a vapor phase signal to a liquid phase signal. At this time, the front end drainage and liquid phase pipe drainage mix and flow towards the designated rear end throat. Due to the unchanged throat area setting, the maximum drainage displacement occurs when the liquid level rises to the required normal water level (the rear valve core is the control expansion end); When the liquid level decreases, the steam consumption signal increases and enters the regulator, reducing the effective flow area of the throat drainage and the drainage discharge, thereby achieving the purpose of controlling the water level.

Features

- Phase change tube (signal tube): To collect vapor and liquid phase signals based on the liquid level.
- Self regulating liquid level controller: The main equipment for controlling the liquid level.
- Bypass valve: A gate valve that corrects errors caused by inaccurate parameter provision.
- Inlet valve: A gate valve.
- Steam valve: A gate valve.
- Heater
- Connection short pipe

Illustration

1. Max. design working pressure $\leq 16\text{MPa}$
 2. Max. design working temperature $\leq 455\text{ }^\circ\text{C}$
- When the original drainage pipe diameter $\text{DN} > 150$, connect with a reducing pipe, When $\text{DN} \leq 150$, products of the same specification can be directly selected.
4. Adjust the steam consumption is approximately 3% of the drainage volume flow rate.

Air Trap

Air Trap

The basic concept of air trap is an automatic device that discharges the water (or liquid) in the air storage tank, gas equipment and non condensable gas pipeline through the drain valve without gas leakage. The drainage of air pipeline is called air trap, and using in non condensable gas pipeline is called drain valve. Air traps are characterized by large capacity,

long life, good energy-saving effects, water hammer resistance, and beautiful appearance. They are widely used in compressed air or non condensable gas tanks, pipelines and air separation equipment. The technical advantages of VMV traps are unique and reasonable structure and high-precision internals!

High Strength Corrosion Resistance

Using WCB material, full consideration of corrosion allowance, minimum shell wall thickness, pressure and temperature rating.

Flexible Closing System

Single valve seat and flexible closing system are adopted to ensure super long service life and closing accuracy.

Built-in Filter Device

It can effectively prevent pipeline impurities from entering the valve, ensuring the normal operation of the trap, and prevent water hammer from damaging internal components.

Pressure Equalizing Flange

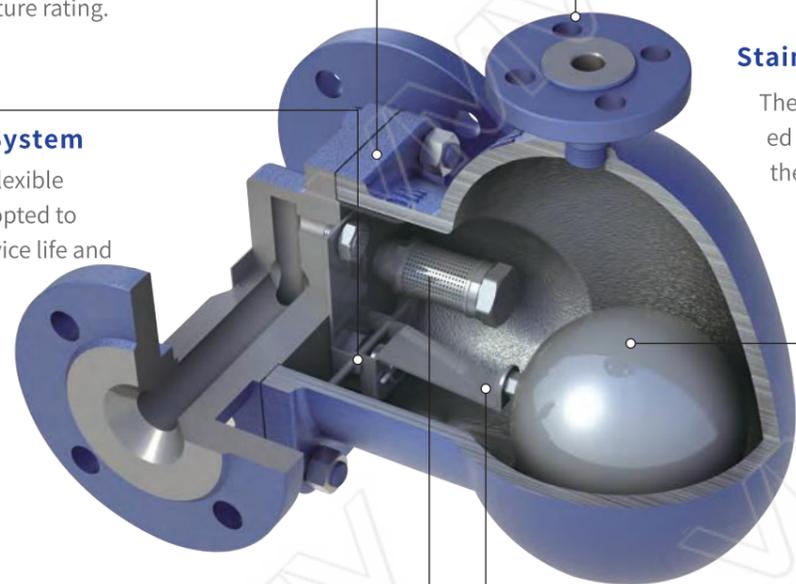

Structure with pressure equalizing balance pipe
Air blockage

Stainless Steel Float

The flawless laser-welded floating ball ensures the long working life of the steam trap

Unique Float Assembly

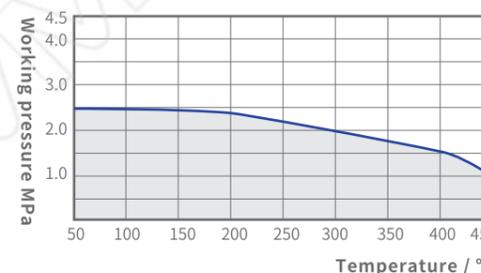

Precisely calculated floating ball component structure makes the closing system work under water seal without steam leakage.

Structural Features

VMV applies the flexible closing system to air trap, which solves the problems of short life-time and bad sealing. In the design, factors such as shell strength, pressure and temperature grade, casting processability, fluid flow path, impact caused by water and vapor mixing, closing of the auxiliary water seal, and the strength of the valve cover gasket affected by the low temperature environment are fully considered. Air trap relies on the density difference between steam and condensate to work. When the valve body is full of non-condensable gas, the gas is discharged through the balance pipe, and the water enters the trap. The floating ball moves up and drives the valve core to open. After discharging the condensed water, the floating ball drives the valve core to move down and closes the drain valve. Air trap has the following advantages, long life, reliable operation, convenient maintenance, no original steam leakage. The greatest advantage of the air trap is can work under pressure as low as 0.1bar.

WCB/A105 Material PN25 Valve Body Pressure - Rating Temperature

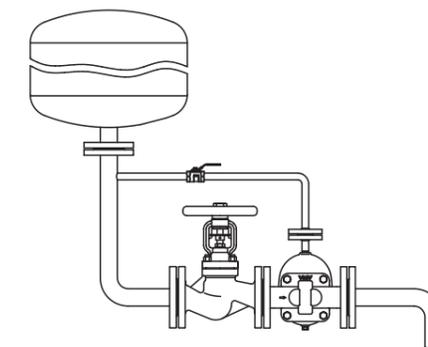

Air Trap Selection and Installation

The air trap can drain water continuously. It is suitable for discharging water or liquid from gas transmission pipeline, gas storage tank and air separation unit. Generally, the safety factor is 2-3 times when selecting models. The displacement of air trap increases with the increase of pressure difference. Check the displacement curve in detail. Special reminder: Please do not mistakenly think that the large diameter trap with large displacement. The air trap is installed horizontally at the bottom of the pipeline or equipment, being equipped with pressure equalizing and balancing pipe and flange as leaving factory-(PN25, DN10 RF). The basic configuration is shown on the graph.

The air trap is made of ASTM216 WCB cast steel, part of the valve cover is made of ASTM A105, the internals are made of stainless steel, with built-in filter.

- Nominal pressure: PN25;
- Maximum allowable temperature: 200°C/2.45MPa;
- Maximum working pressure: 2.5MPa;
- Maximum working temperature: 200°C;
- Connection type: thread RC or flange (GB/T 9115.1-2000; HG/T20615-2009; HG/T20592-2009, etc.)

Installation method: remove the upper plug, screw on the balance pipe with flange, and connect the air inlet pipe and balance pipe.

Pump Trap System

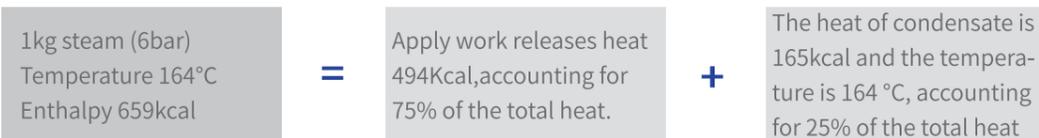

Properties of Steam & Condensate Recovery

Pump Trap T20

Why recycle condensate

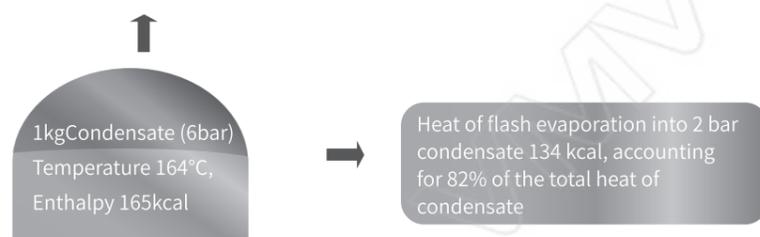

The steam generates condensate through heat exchange. The condensate is separated and discharged through the steam trap. The condensate contains a lot of heat energy.

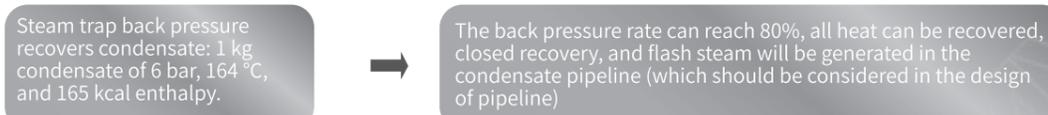

Condensate heat energy recovery method

Recovery of heat energy by flash tank

2 bar low-pressure steam 0.058 kg is generated, and the temperature is 133 °C, accounting for 19% of the total heat of condensate

Steam trap back pressure recovers condensate heat energy

Electric pump recovers condensate heat energy

Recovers condensate heat energy

VMV condensate recovery pump (pump trap) first came from foreign technology, originally meaning "pump trap", also known as mechanical power pump. It uses the principle of steam trap and relies on steam, air and other gases as power to transport condensate from low-pressure area to high-pressure area, or from negative pressure area (vacuum) to normal pressure area.

Condensate recovery pump has a series of advantages, such as automatic control, no cavitation, simple maintenance, no need for electricity, water hammer resistance, large capacity, explosion-proof, no noise, and the head of delivery determined by the pressure of power steam (gas), which is unmatched by other pumps. It is widely used in the transportation of condensate in steam system and liquid with low viscosity and no volatilization.

Convenient Replacement and Maintenance

Open the valve cover at a glance without removing the pipe connection

High Corrosion Resistance

High temperature alloy spring is used for long-term stable operation at 540°C

Selection Conditions of Pump Trap

1. Condensate delivery capacity kg / h
2. Back pressure (head of delivery) MPa
3. Power steam (air)
4. Power steam (air) pressure MPa
5. Water inlet normal diameter DN
6. Water outlet normal diameter DN

Valve Core and Valve Seat

The valve seat and valve core are made of stainless steel, and the closing pair adopts flexible closing system with small wear, reliable closing and long service life

Long Life and High Precision

Welding of key parts
The accuracy of key parts of stellite alloy can reach μm level
The key parts are welded with Stellite alloy, and the precision of key parts can reach micron level

Pump Trap

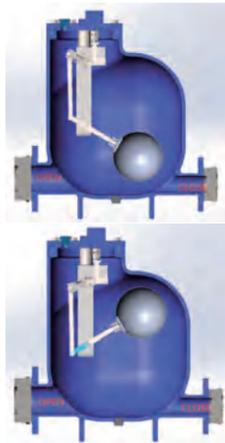

Pump Trap

Pump Trap **PT20**

Working Principle

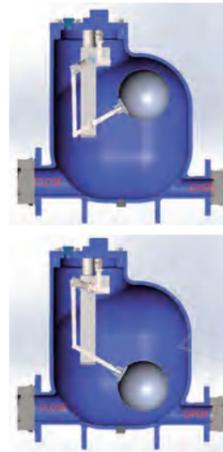

Enter condensate and exhaust steam(air)

At the beginning, the water inlet check valve is opening, the water outlet check valve is closed due to high back pressure, the water start to enter the pump, and the floating ball is at a low level, with the rise of water level and the opening of exhaust valve, the floating ball reaches the highest controller and is in the switching critical state.

Enter steam(air) and exhaust condensate

The controller starts switching at the high position and closes the exhaust valve: open the power steam (air), inject steam into the valve, and push the condensate in the pump to the high-pressure area under the steam pressure: at this time, the water inlet check valve cannot feed water due to the high pressure in the pump. When the floating ball reaches the low position, the controller switches to close the power steam and opens the exhaust valve to enter the next action cycle.

Technical Parameter

Design Standards

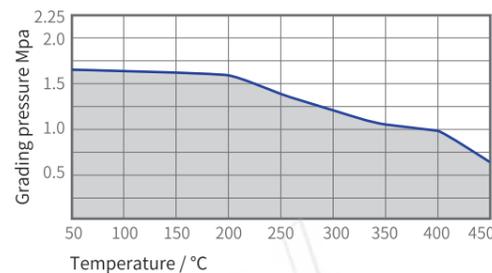

- GB / T22654-2008 Technical conditions for steam traps
- GB / T12251-2005 Test methods for steam traps
- GB / T12224-2005 General requirements for steel valves

Nominal pressure	PN16(150LB)	Design pressure of valve body	2.5MPa	Water inlet diameter	DN80 RF
Maximum allowable pressure	1.6MPa/204°C	Maximum allowable temperature	300°C /1.23MPa	Water outlet diameter	DN50 RF
Maximum working pressure	1.37MPa/250°C	Maximum operating temperature	250°C /1.37MPa	Steam outlet diameter	1" RC

Valve core	440C	Fastener	Carbon steel grade 8.8
Spring	Ni Base Superalloy	Gasket	SS304+flexible graphite

WCB/A105Material PN16 valve shell pressure temperature rating

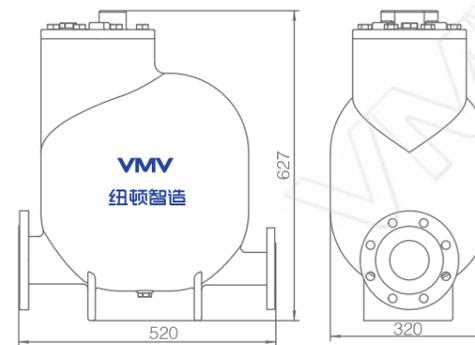

Performance Characteristics

- Non electric drive, driven by steam or compressed air, explosion-proof and safe, and can be used in any environment.
- Compact structure, without any requirements for installation, even in the open field, its normal operation will not be affected.
- Automatic control, the amount of the water output is determined by the water inflow. When the amount of condensate increases, the working frequency increases, when it decreases, the working frequency decreases, and the work stops once there's no condensate.
- No cavitation work, which completely overcomes the cavitation defect of electric pump.
- All stainless steel internals and special materials ensure performance and service life.

Remarks

- It is recommended that the head height of fluid entering is more than 0.5m (the pump cover is the benchmark), and the "correction coefficient of inlet height" can be referred to;
- Power steam inlet connection RC1 / 2 ";
- For the normal operation of the pump, the saturated condensate needs flash or condensation treatment, and the closed system must ensure the differential pressure and back pressure rate of the normal operation of the steam trap.
- The standard configuration of condensate inlet and outlet is HG/ T20592-2009 PN16 flange connection. If ASME16.5, JIS and other standards is required, please specify.

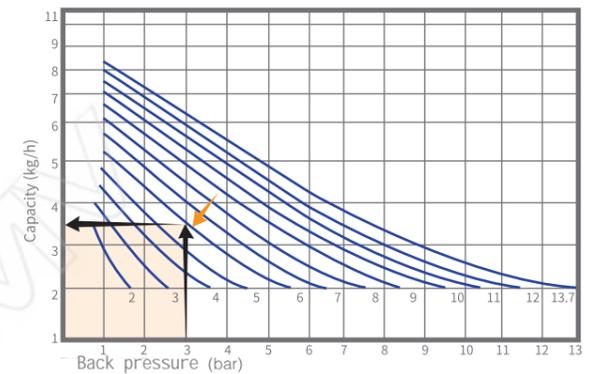

Structure diagram

Maintenance

Attached accessories: one set of valve cap gasket and one set of valve seat gasket. Recommended spare parts list: one valve seat, one valve core and one spring.

PT20 Capacity Chart

How to check the displacement

For example:
The power steam pressure is 6bar, and the back pressure at the rear end is 3bar (1bar = 10m).
Step 1: Find out the power steam 6bar curve, and see the curve pointed by the yellow arrow;
Step 2: Lift 30m, means back pressure 3bar (1bar=10m), Find the lower horizontal axis 3bar and move it up to 6bar to intersect the curve (see the black arrow);
Step 3: Move the intersection to the left to find out the capacity value and get the capacity of 3.5t/h;
Step 4: 3.5t/h x head height correction coefficient = actual capacity

Head Height Correction Coefficient

Inlet Height (m)	Capacity Correction Factor			
	DN25	DN40	DN50	DN50*DN50
0.15	0.90	0.75	0.75	0.80
0.30	1.00	1.00	1.00	1.00
0.60	1.15	1.10	1.20	1.05
0.90	1.35	1.25	1.30	1.15

Maintenance cycle: After one year of operation, open the pump cover to check the wear of mechanical parts, and open the sewage outlet for sewage discharge once without removing the connecting pipe.

Pump Trap

Pump Trap

PT10 Pump Trap

Product Features

1. There will be no cavitation when discharging high-temperature condensed water.
2. No need for electric drive or installation of liquid level control devices, which is safer to use.
3. Low head operation (minimum 300mm).
4. Online replacement of internal components makes cleaning very simple and reduces maintenance costs.
5. High quality stainless steel internals and hardened working surfaces ensure the reliable operation of the pump.
6. Compact structural design minimizes installation space.

Installation Precautions

Check valves must be installed at the inlet and outlet of the pump type drain valve. Choose a connection method based on the interface format.

The pressure of the power medium minus the back pressure > 0.05MPa.

If a closed recovery system is used, the power medium used must be consistent with the fluid being pumped. When using non condensable gases such as air and nitrogen as power media, please communicate and confirm with us.

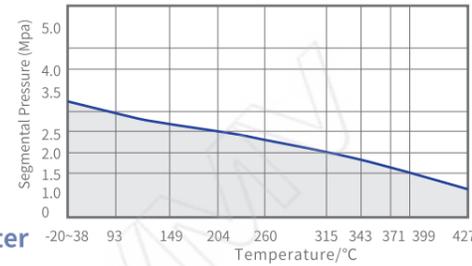

Application

Compact pump trap is suitable for condensate discharge or recovery, with a wide range of applications. It is used to discharge low flow condensate in low level storage tanks.

Pump Trap PT10

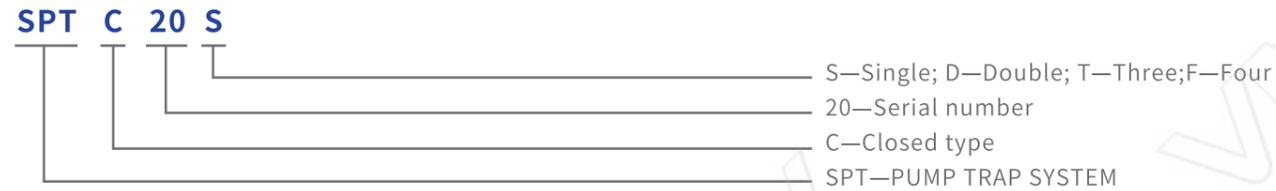

Pump Trap System

Pump Trap System

VMV pump trap system device is a complete recovery system composed of pump steam trap and control valve of water collecting tank. It only needs to be connected with power steam, inlet pipe and return pipe to operate.

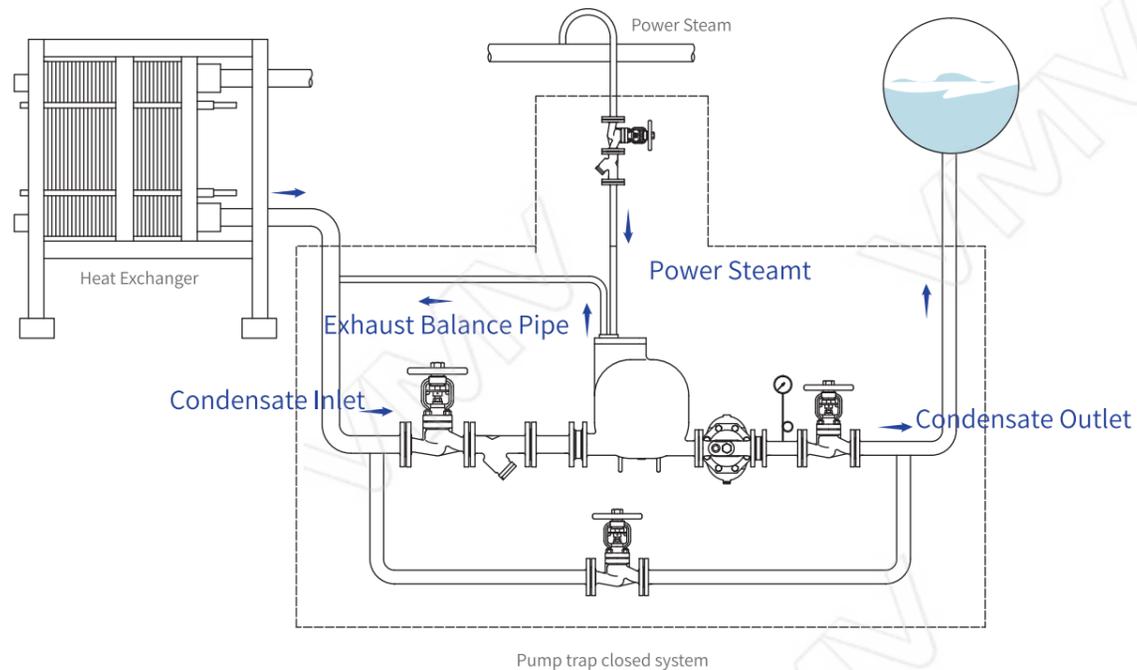

According to the capacity, VMV pump trap system device is divided into single pump trap system device SPT20S, double pump trap system device SPT20D, three pump trap system device SPT20T and four pump trap system device SPT20F. According to the system, it is divided into open system and closed system.

Product Model Compilation:

Model of open system: SPT20S, SPT20D, SPT20T, SPT20F
 Model of closed system: SPTC20S, SPTC20D, SPTC20T, SPTC20F

Pump Trap Closed System

Single Pump Trap System Device (Open) SPT20S

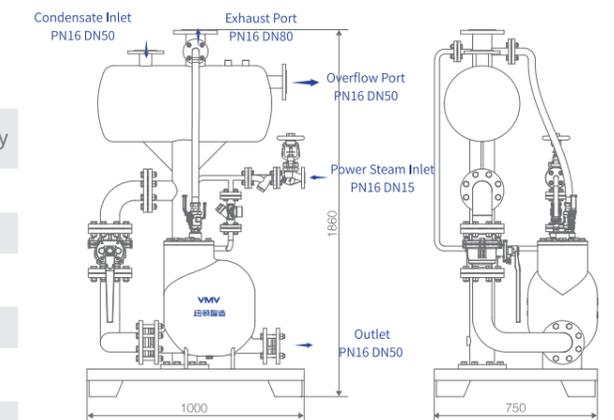

- Model: SPT20S (open system)
- Name: Single Pump Trap System Device (open)
- Weight: 280kg
- Volume: 1000x750x1688 (mm)
- Nominal pressure: PN16
- Maximum allowable pressure: 1.6mpa/204 ° c
- Maximum working pressure: 1.37mpa/250 ° c
- Flange standard: hg/t20592; pn16 rf
- Power steam consumption: 5kg / t (condensate)
- Power air consumption: 7.6m3/t (condensate)
- Limitation: The water collecting tank (upper water tank) is not under pressure and is only used as open buffer water collection.

Technical Standard

Three Pump Trap System Device (Open) SPT20T

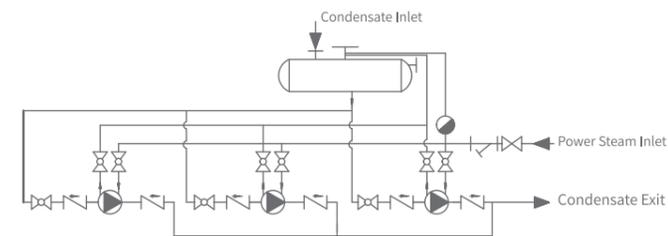

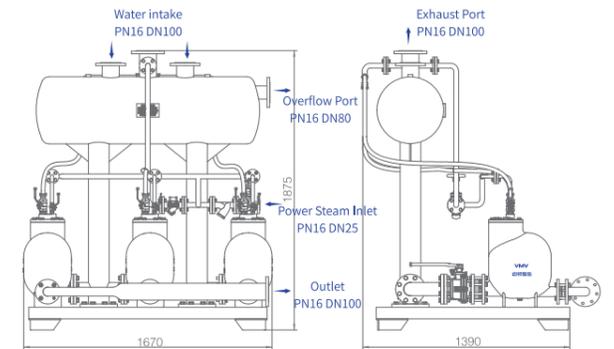

Model: SPT20T (open system)
 Name: Three Pump Trap System Device (Open)
 Weight: 740kg
 Volume: 1670x1390x1875 (mm)
 Nominal pressure: PN16
 Maximum allowable pressure: 1.6mpa/204 ° c
 Maximum working pressure: 1.37mpa/250 ° c
 Flange standard: hg / t20592; pn16 rf
 Power steam consumption: 5kg / t (condensate)
 Power air consumption: 7.6m3/t (condensate)
 Limitation: The water collecting tank (upper water tank) is not under pressure and is only used as open buffer water collection.

Technical Standard

- GB/T12250-2005 Steam Traps Terminology Marking
 - GB/T22654-2008 Technical conditions of steam traps
 - GB/T12251-2005 Test methods for steam traps
 - ISO 6948 Automatic steam traps
- Production and performance characteristic tests

Heating System Solution

Typical Heating System

Bellows Stainless Steel Steam Manifolds

Product Description

VMV typical heat tracing system" integrates all the components required by steam distribution tube bundle and condensate collection tube bundle (steam trap, manifold, valve, etc.), and puts all the components together. The manifold is the integrated "chip" of the process pipe the device cost and providing compact and easy disassembly centralized positioning components.

Application Of Manifold

Steam distribution manifold and condensate collection manifold are widely used in petroleum refining, textile raw material chemical industry, coal chemical industry, etc. With the advantages of convenient management and maintenance, high product quality, low construction cost and short construction period.

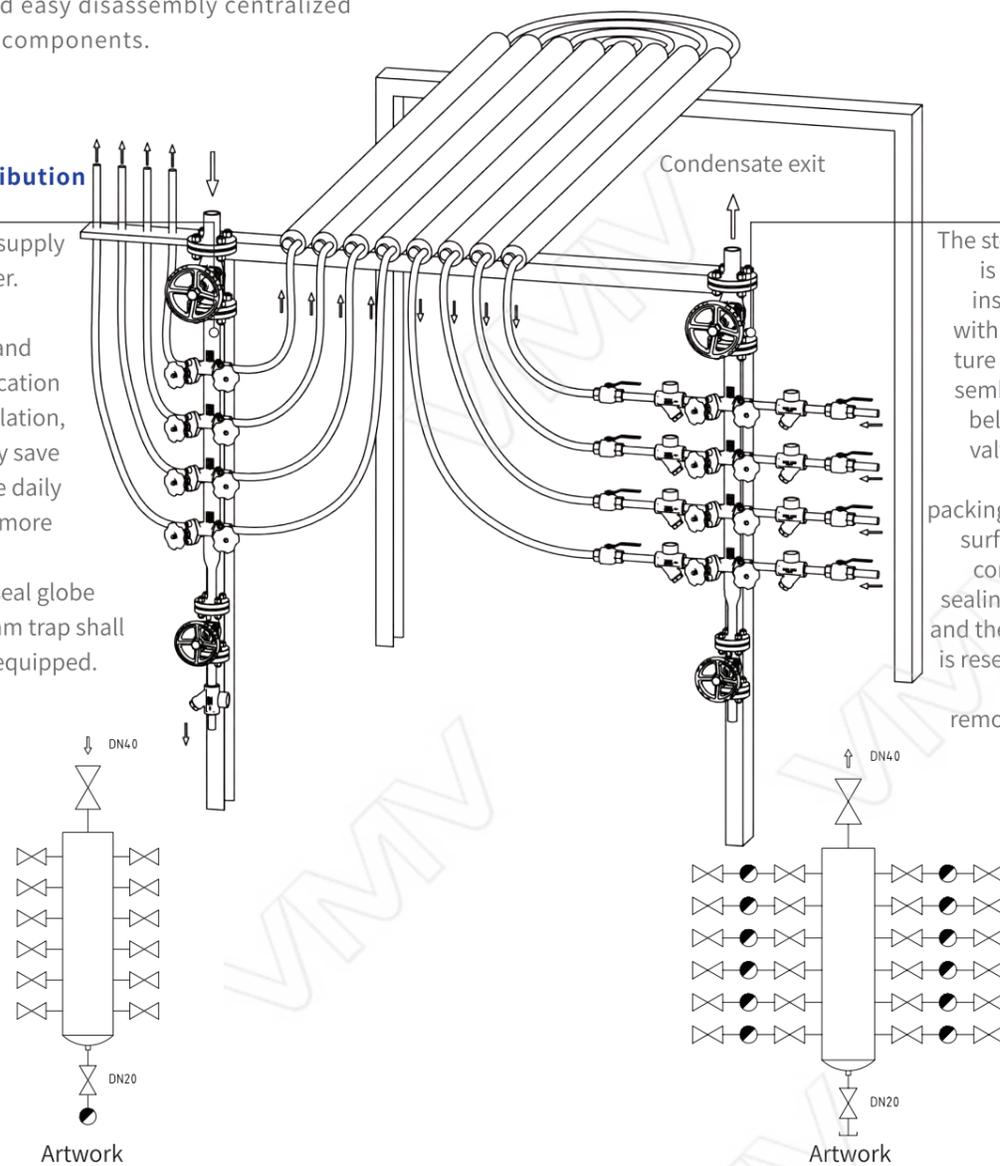

Product Description

VMV Bellows Stainless Steel Steam Manifolds"incorporate integral bellows sealed globe valves for steam distribution and condensate collection systems. Depending on the installation,BSPM and BCRM can be used for steam distribution or condensate collection.

The main body adopts the medium temperature wax silica sol precision casting process, and the material CF8 has strong corrosion resistance.

Steam Distribution Manifold

Put all steam supply valves together. Standardized components and centralized location simplify installation, fundamentally save cost and make daily maintenance more convenient. VMV bellows seal globe valve and steam trap shall be equipped equipped.

Condensate Collecting Manifold

The steam trap group is assembled and installed together, with compact structure and easy disassembly. The built-in bellows seal globe valve ensures zero leakage at the packing. The spherical surface of the valve core improves the sealing performance, and the draining valve is reserved for convenience and the removal of impurity.

Manifolds Body

High strength and corrosion resistance
Temperature resistant up to 350°C
Precision casting, exquisite appearance
Integrated, compact structure

Handwheel

Corrosion-resistant material
Beautiful
Good grip

Threaded Pressure Sleeve

Packing and thread pressure sleeve
Avoid loosening
Martensitic stainless steel
High hardness and corrosion resistance

Valve Core, Valve Seat

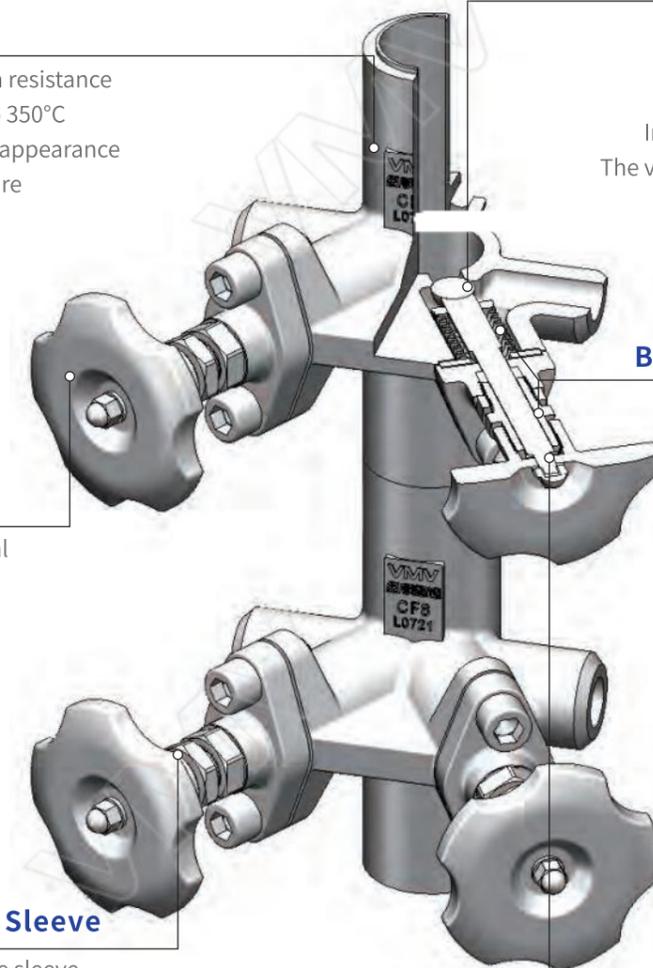

Integral spherical valve core
Matching Conical Seat
Achieve linear sealing
Improve sealing performance
The valve core adopts martensitic hardening treatment
Improve scour resistance

Bellows Components

Built-in stainless steel bellows components and graphite packing realize double sealing guarantee of valve stem

Concealed Drive Thread

The drive thread is placed inside the handwheel
Dustproof and waterproof,
Easy to switch

Bellows Stainless Steel Steam Distribution Manifolds

Bellows Stainless Steel Steam Distribution Manifolds

Structural Features

- Integrated design, solid structure, shorten on-site construction time.
- Maximize saving installation space and easy maintenance
- Integral ball seal face and V-line seal seat ensure perfect sealing.
- Adopting stainless steel bellows design, it is easily opened and becomes durable and non-leaking.

Technical Standard

- GB12224-1989 General Requirements For Steel Valves
- GB12228-1989 General Valve Carbon Steel Forgings Technical Conditions
- GB/T 9131-2000 Steel Pipe Flange Pressure-Temperature Class
- GBT13927-2008 Industrial Valve-Pressure Test
- GBT1048-2019 Definition and Selection of Nominal Pressure of Piping Components

Steam Distribution Manifolds

When installing, it is recommended that the steam inlet is installed at the top, and the steam trap set at the bottom. It is best to recover the condensed water discharged from the trap group. If it is directly discharged into the atmosphere, it is recommended to install a silencer.

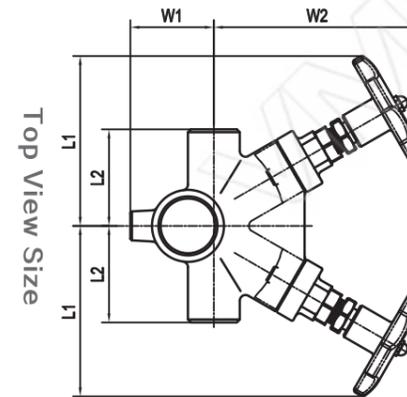

Condensate Manifolds

During installing, it is recommended that the condensate outlet is at the top, and the bottom should be installed with a shut-off valve for sewage discharge.

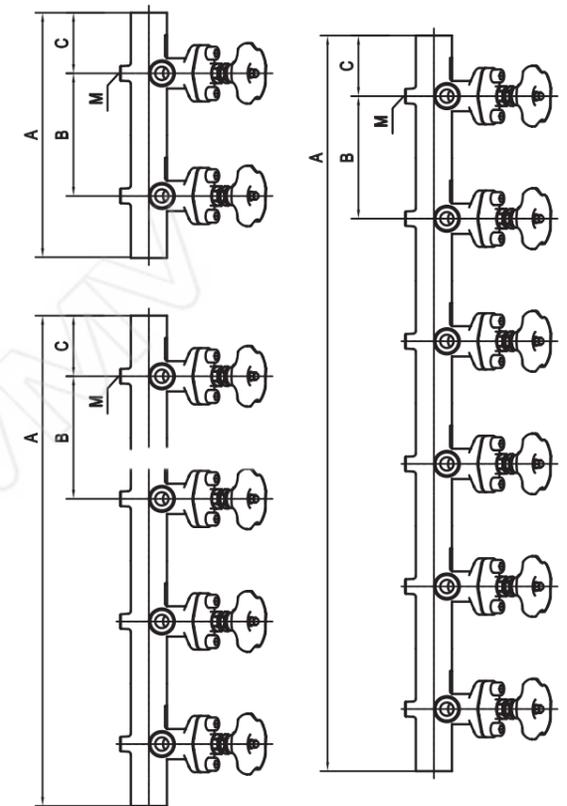

Material Table

Manifolds	CF8
Bonnet	CF8
Bellows Assembly	SS304
Stem	SS304
Valve Core	SS440C

Unit(mm)

Technical Parameters

Nominal pressure	PN40/Class300
Max. allowable pressure (shell)	3.03Mpa/200°C
Max. allowable temperature (shell)	450°C/2.16MPa
Max. working pressure	2.56MPa
Max. operating temperature	350°C
Factory cold test pressure	6.0MPa
Air Seal test	2.0MPa

Notice

- During operation, the bellows globe valve should be fully opened or fully closed, and cannot be used for throttling.
- Do not use strong wrench to close the valve, preventing damage from the bellows caused by excessive torque.

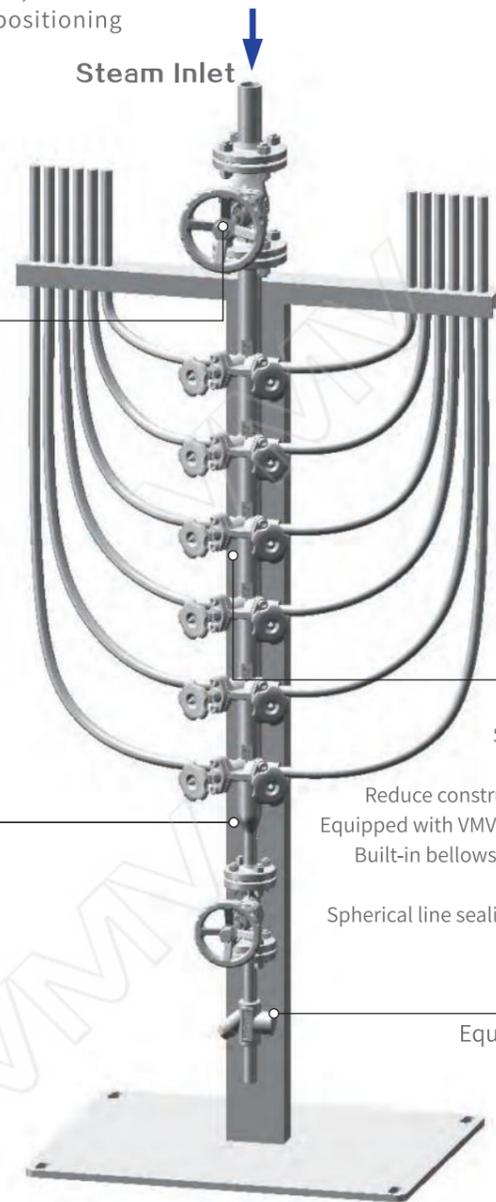

Bellows Stainless Steel Steam Distribution Manifolds

Bellows Stainless Steel Condensate Collection Manifolds

Product Description

VMV's "Steam Distribution Manifolds" integrates all the components required for it (steam traps, manifolds, valves, etc.). All components are installed on the base bracket, and the manifolds are scientifically distributed on both sides to provide a compact, easy-to-disassemble centralized positioning assembly.

The Body is made of corrosion resistant material CF8, which is suitable for high-end manifolds, instruments, chemical corrosion-resistant pipes and pipeline heating. The instrument heating distribution pipes can be connected by ferrules.

Bellows Sealed Globe Valve

- Equipped with bellows sealed globe valve for steam inlet
- Ensure zero leakage and maintenance free at the packing
- Line Sealed Seat
- Improve sealing performance
- Precision machined stainless steel handwheel
- Ergonomically designed

Manifolds Stainless Steel Material

Centralize all steam distribution valves
Standardized and integrated skid-mounted combination

Reduce construction time and cost for on-site installation
Equipped with VMV bellows sealed globe valve and steam trap
Built-in bellows sealed globe valve ensures zero leakage at packing
Spherical line sealing structure of valve core improves sealing

Steam Trap

Equipped with a steam trap at the bottom
Remove condensate

Manifolds Assembly Base

- Optional customized steel base and frame
- Manifolds on both sides for optimal installation sequencing
- Easy on-site installation

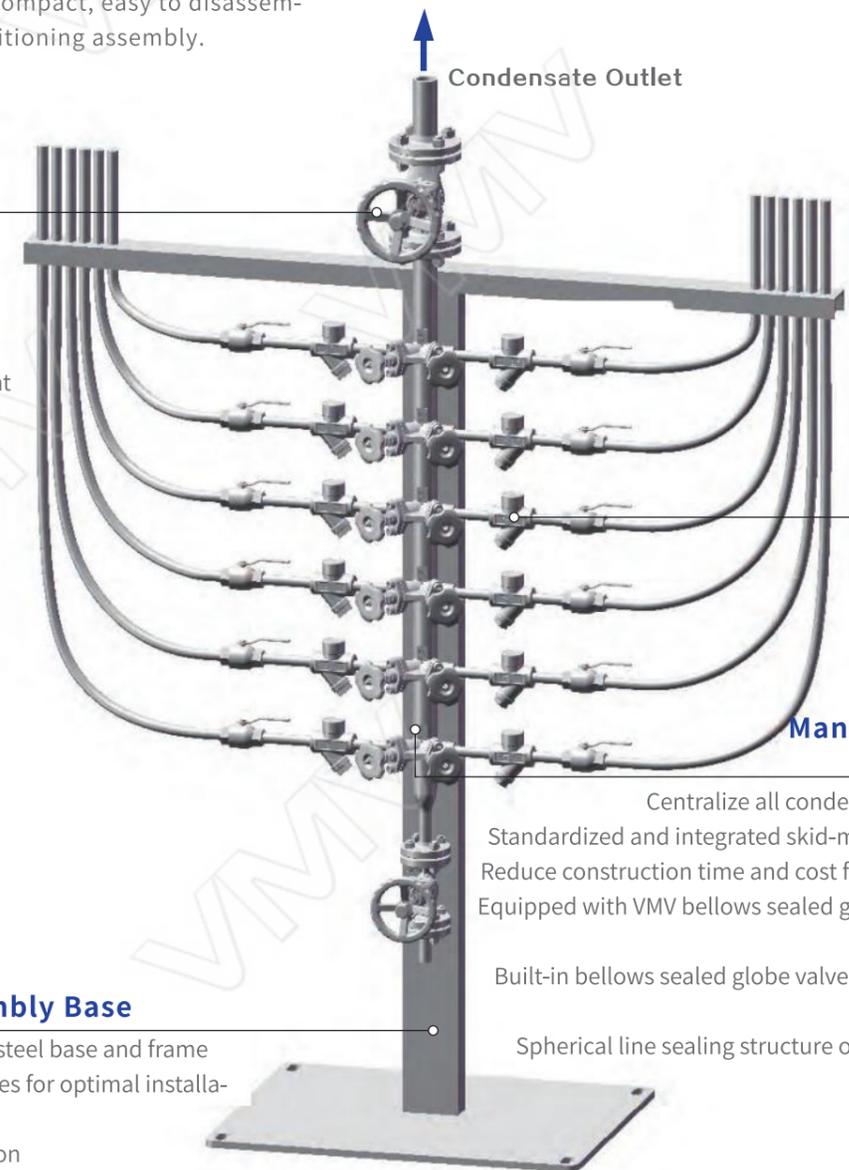

Product Description

VMV's "Condensate Manifold" integrates all components required for it (steam traps, manifolds, valves, etc.). All components are installed on the base bracket, and the manifolds are scientifically distributed on both sides to provide a compact, easy to disassemble centralized positioning assembly.

The Body is made of corrosion resistant material CF8, which is suitable for high-end manifolds, instruments, chemical corrosion-resistant pipes and pipeline heating. The instrument heating recovery pipes can be connected by ferrules.

Bellows Sealed Globe Valve

- Condensate outlet configuration
- Bellows sealed globe valve
- Ensure zero leakage at the packing
- Maintenance free
- Line Sealed Seat improves sealing performance
- Precision machined stainless steel handwheel

Steam Trap

Configure thermodynamic, thermostatic, bucket inverted and other types of steam traps

Manifold Stainless Steel Material

Centralize all condensate recovery valves
Standardized and integrated skid-mounted combination
Reduce construction time and cost for on-site installation
Equipped with VMV bellows sealed globe valve and steam trap

Built-in bellows sealed globe valve ensures zero leakage at packing

Spherical line sealing structure of valve core improves

Manifold Assembly Base

- Optional customized steel base and frame
- Manifolds on both sides for optimal installation sequencing
- Easy on-site installation

Bellows Forged Steel Manifolds

Bellows Forged Steel Manifolds

Product Description

VMV's "Bellows Forged Steel Manifolds" have built-in bellows sealed globe valves for steam distribution and condensate collection systems. Depending on the installation, BSPM and BCPM can be used for steam distribution or condensate collection.

The main body adopts the overall forging process material A105, which is dense and high in strength. Suitable for heat tracing of chemical pipelines. They are suitable for highend manifolds,instru-ments,chemical corrosion resistant pipes and pipeline heating.

Manifold Body

High strength and corrosion resistance
Temperature resistant up to 350°C
Integrated, compact structure

Handwheel

Integral molding of handwheel
made of die-cast aluminum material
Light weight and high strength
Beautiful and compact, good grip

Gland,Packing Gland

The packing compaction structure is
center-adjustable
Split gland,packing gland
Prevent valve stem from sticking

Valve Core, Valve Seat

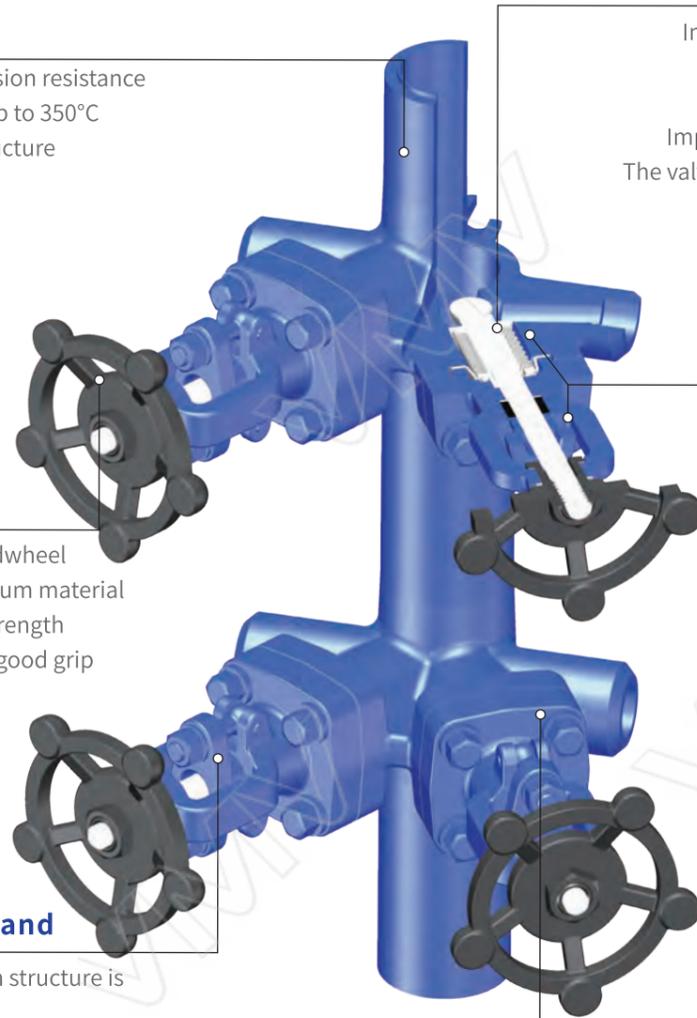

Integral spherical valve core
Mating Conical Seat
Achieve linear sealing
Improve sealing performance
The valve core adopts martensitic
hardening treatment
Improve scour resistance

Bellows Assembly

Built-in stainless steel
bellows assembly
It and the graphite
packing realize the
double sealing guaran-
tee of the valve stem

Valve Bonnet

Special custom forged bonnet
High structural strength

Technical Parameter

Nominal pressure	PN40/Class 300
Max. allowable pressure (shell)	3.92MPa/200°C
Max. allowable temperature (shell)	450°C/1.66MPa
Max. working pressure	4.0MPa
Max. operating temperature	350°C
Factory cold test pressure	6.0MPa
Air test	2.0MPa

Notice

During operation, the bellows sealed globe valve should be fully opened or fully closed, and cannot be used for throttling. Refuse to use an torque wrench to close the valve to prevent the bellows from being damaged by excessive torque.

Structural Features

- Integrated design, solid structure, shorten on-site construction time
- Maximize installation space saving and easy maintenance
- Integral ball core sealing surface and Stellite alloy hardened seat for perfect sealing
- Adopt stainless steel bellows design, durable,easy to open, eliminate leakage at the packing.

Technical Standard

- GB12224-1989 General Requirements For Steel Valves
- GB12228-1989 General Valve Carbon Steel Forgings Technical Conditions
- GB/T 9131-2000 Steel Pipe Flange Pressure-Tempera-Ture Class
- GBT13927-2008 Industrial Valve-Pressure Test
- GB/T 20919-2019 Definition and Selection of Nominal Pressure of Pipeling Components

Steam Distribution Manifolds

When installing, it is recommended that the steam inlet be installed at the top and the steam trap set the bottom. It is best to recover the condensate water discharged from the steam trap group. If it is directly discharged into the atmosphere, it is recommended to install a silencer.

Condensate Collection Manifolds

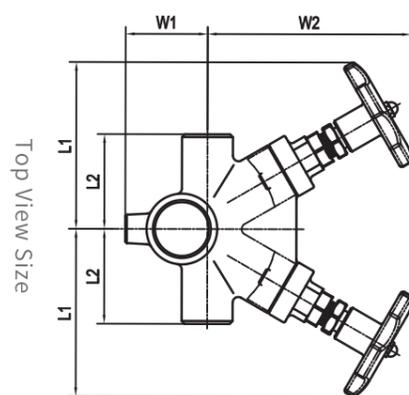

During installation, it is recommended that the top be the condensate outlet, and the bottom should be installed with a shut-off valve for sewage discharge.

Bellows Forged Steel Condensate Collection Manifolds

Bellows Forged Steel Condensate Collection Manifolds

Product Description

VMV's "Condensate Manifold" integrates all components required for it (steam traps, manifolds, valves, etc.). All components are installed on the base bracket, and the manifolds are scientifically distributed on both sides to provide a compact, easy to disassemble centralized positioning assembly.

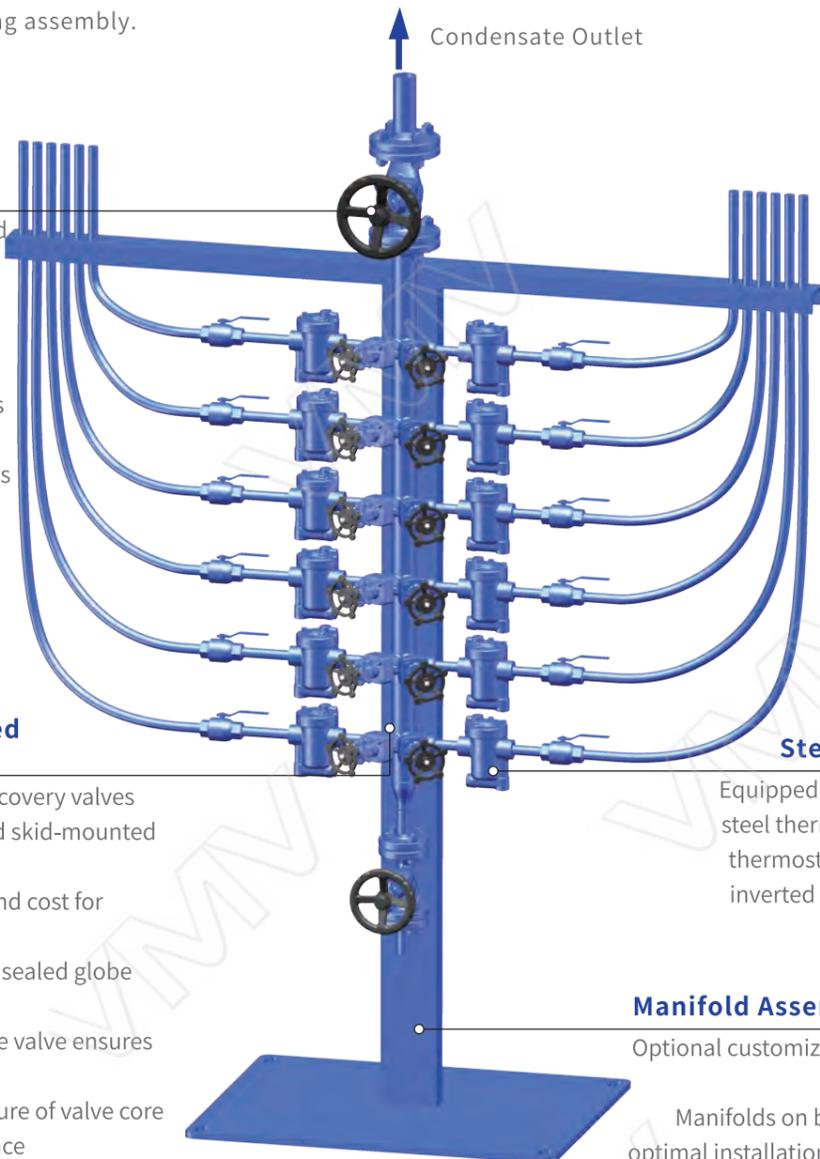

The Body is made of forged carbon steel material A105, the main body is dense, and it is suitable for high-pressure chemical pipelines and pipe-line heating.

Bellows Sealed Globe Valve

- Condensate outlet equipped with a bellows sealed globe valve
- Ensure zero leakage at the packing
- Linear sealing seat improves sealing performance
- Precision machined stainless steel handwheel
- Maintenance free
- Ergonomically Design

Manifolds Body Forged Carbon Steel

- Centralize all condensate recovery valves
- Standardized and integrated skid-mounted combination
- Reduce construction time and cost for on-site installation
- Equipped with VMV bellows sealed globe valve and steam trap
- Built-in bellows sealed globe valve ensures zero leakage at packing
- Spherical line sealing structure of valve core improves sealing performance

Steam Traps

Equipped with carbon steel thermodynamic, thermostatic, bucket inverted steam traps.

Manifold Assembly Base

Optional customized steel base and frame
Manifolds on both sides for optimal installation sequencing
Easy on-site installation

Stainless Steel Steam Trap Combination

Equipped with stainless steel bucket inverted steam trap and stainless steel steam trap station, (Front and rear stainless steel globe valve, stainless steel filter, check valve)

Fully enclosed, vibration-proof shell
Small, lightweight traps
Freeze-resistant, no damage
Super anti-corrosion performance

Manifold Assembly Base

Optional customized steel base and frame
Manifolds on both sides for optimal installation sequencing
Easy on site installation

Manifolds Body Forged Steel Material

A105 forged steel material
Hexagonal steel pipe design
Fully consider corrosion allowance
Super strong siphons inside the manifolds form water seal
Back pressure recovers condensate at low points in the pipeline

V8000 Series Control Valve

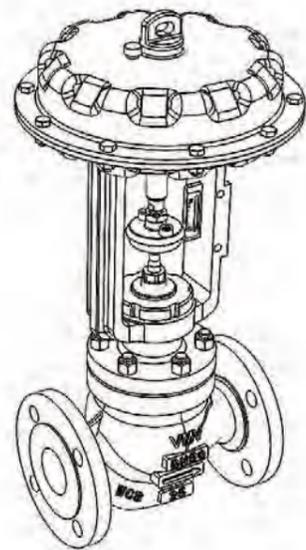

V8000Series Control Valve

Product Description

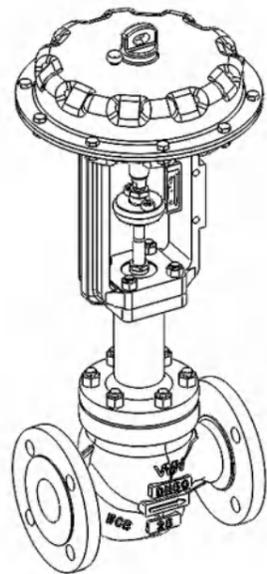

VMV V8000 series control valve is a straight through structure, with the advantages of high adjustment accuracy, good stability, fast response speed, easy on-site maintenance, etc., and also can be used in cavitation, flash, easy to scour and other special conditions, can meet the requirements of most working conditions. It can be equipped with multi-spring film actuator or electric actuator.

V6000 Series Three-way Control Valve

V6000 Series Three-way Control Valve

Product Description

V6000 series three-way control valve, divided into three-way separating and three-way mixing flow. The main function is to divide an imported fluid into two export fluids, or to synthesize two imported fluids into an export fluid, which can replace two straight control valves, mainly applied for hot oil, steam, condensate, air and other fluid regulation conditions; It has the advantages of high adjustment precision, good stability, fast response speed, easy on-site maintenance, etc. It can be equipped with multi-spring film actuator or electric actuator.

Steam Piping Accessories

The piping system must be equipped with bellows sealed globe valves, filters, check valves, mixers, vacuum breakers, steam water separators, sight glasses.

Control Valve

Controller

Sensor

Vacuum Breaker

Trap Combination

Bellows Sealed Globe Valve

Bellows Sealed Globe Valve

Conical sealing: No impurities remain on the sealing surface. When it tends to close, the sealing surface has a self-cleaning effect to achieve linear sealing.

Balanced disc seal: After the small disc relieves the pressure, it drives the large disc to open easily.

Flat soft seal: The soft seal surface can prevent sparks when opening and closing, and is suitable for gaseous media or working conditions with corrosion resistance requirements.

Structural Features

- The mechanical properties of the castings are good, more than 98% are free of defects such as pores, blisters and cracks, and the effective wall thickness reaches the standard.
- The valve adopts conical sealing design and no impurities remain on the sealing surface. When it tends to close, the sealing surface has a self-cleaning effect. The conical sealing surface can amplify the axial force of the valve stem into the sealing force, and has better performance.

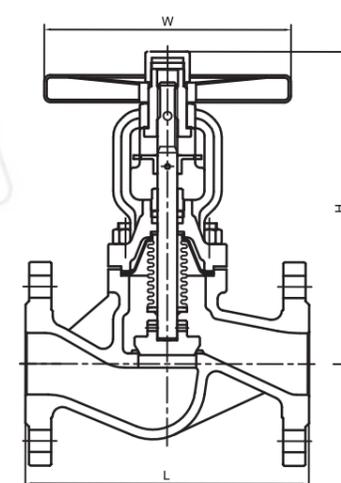

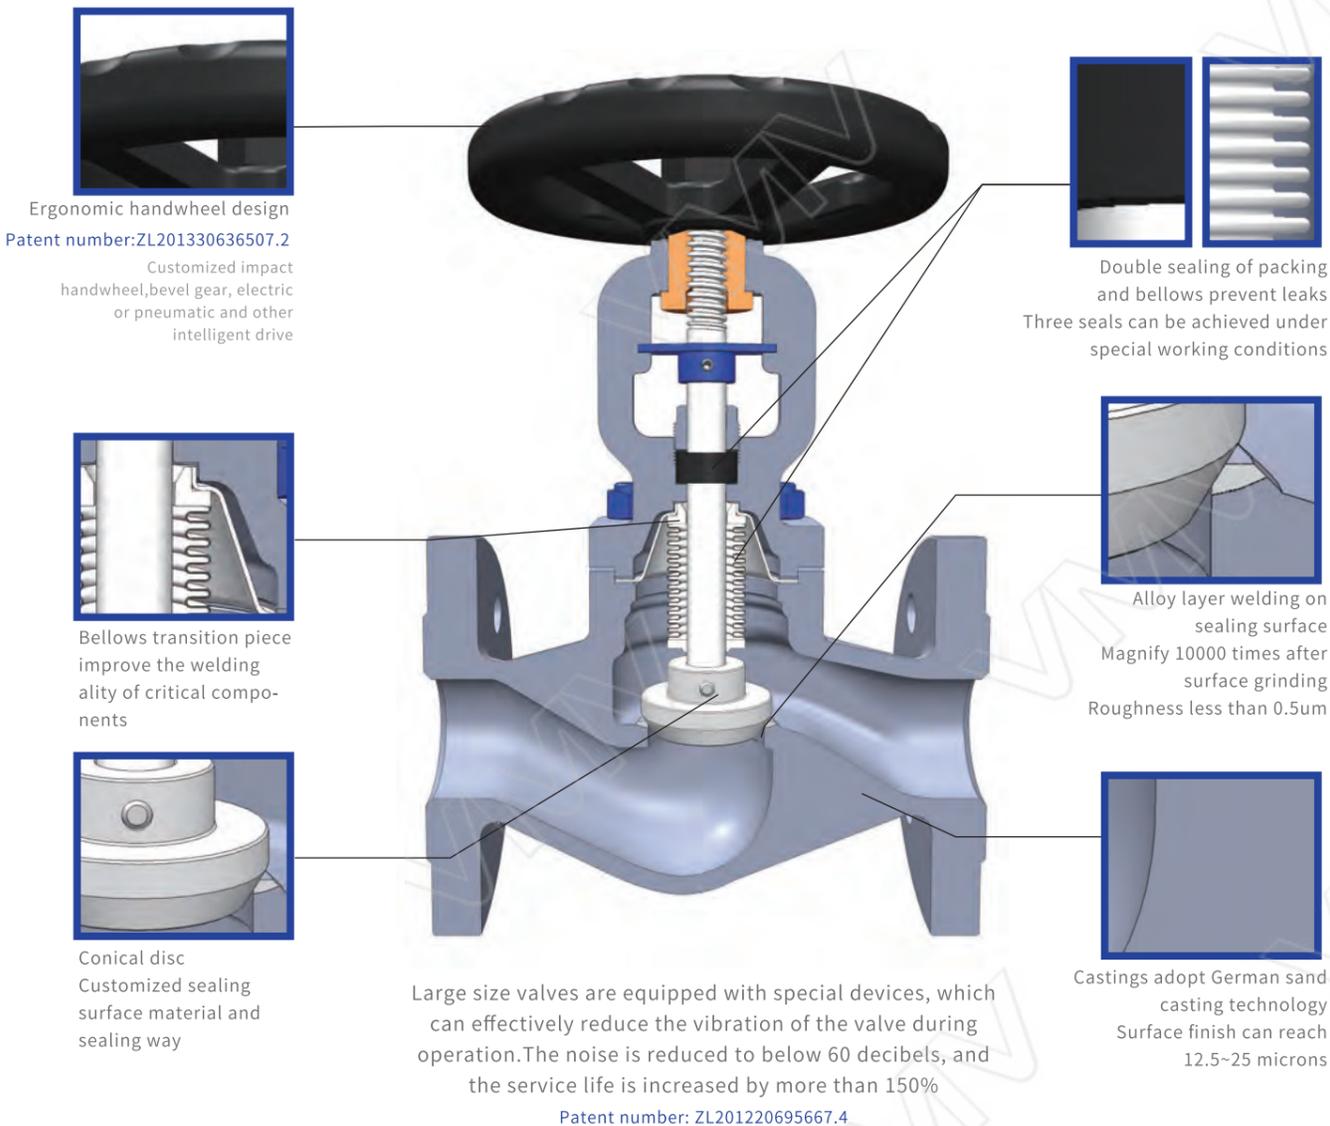

- Double sealing design of bellows and packing, with double guarantee, making the sealing at the valve stem safer and more reliable.
- Bellows are 100% tested for fugitiveness according to ISO15848 Class A standard; all bellows components and valves are 100% tested to Standard Class A to ensure zero leakage.
- Various disc designs can be provided according to working conditions, such as throttling disc, regulating disc, flat soft sealing disc, globe check valve disc, etc.

Technical Specifications

Design standard: EN12516, GB/T12224, GB/T12235

Bellows Sealed Gate Valve

Bellows Sealed Gate Valve

For bellows sealed gate valve, its key component metal bellows, the lower end is welded with the valve stem, and the upper end is welded with the connecting plate, forming a metal barrier between the medium and the atmosphere, ensuring zero leakage of the valve stem.

All bellows are 100% tested for fugitiveness according to ISO15848 Class A standard; all bellows components and valves are 100% tested to standard Class A to ensure zero leakage.

Welding of bellows components: Microcomputer controls the welding speed to ensure the quality of critical components

Structural Features

- Bellows sealed gate valve, its key component metal bellows, the lower end and the valve stem assembly are automatically welded, and the upper end and the connecting plate are automatically welded, forming a metal barrier between the fluid medium and the atmosphere to ensure zero leakage of the valve stem.
- Double sealing design of bellows and packing, with double insurance, making the sealing at the valve stem safer and more reliable.

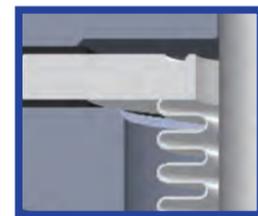

- All bellows are 100% tested for fugitiveness according to ISO15848 Class A standard; all bellows components and valves are 100% tested to Standard Class A to ensure zero leakage.
- The valve cover has its own grease fitting, which can directly lubricate the valve stem, nut and bushing, unlike the traditional lubricating oil only on the thread.
- Ergonomic handwheel design. Electric or pneumatic intelligent drive, impact handwheel, bevel gear can be customized.

Technical Specifications

Design standard: EN12516, GB/T12224, GB/T12234
 F to F Dim: EN558, GB/T12221
 Flange ends: EN1092-I, GB/T9113
 Test inspection: EN12266, GB/T26480

Applicable Media

Steam, hot and cold water, oil, biphenyl, fatty acid, liquid ammonia, ammonia gas, natural gas, etc.

Automatic welding of upper end and connecting plate

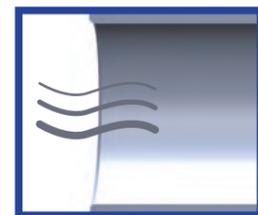

Customized impact handwheel, bevel gear, electric or pneumatic and other intelligent drive.

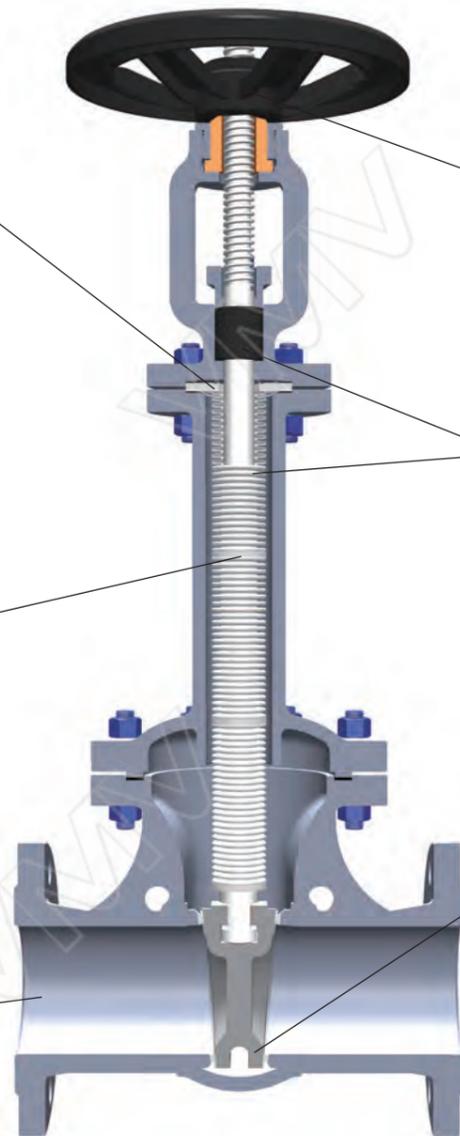

Double sealing design of bellows and packing, with double guarantee, making the sealing at the valve stem safer and more reliable.

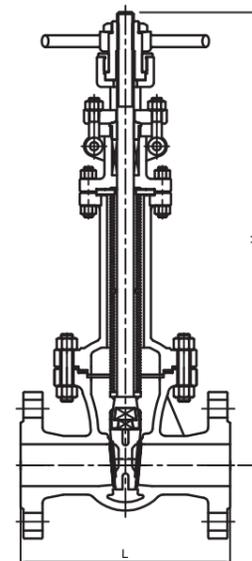

Multi-layer bellows, with guiding structure to prevent instability

Full bore, high flow rate, zero flow resistance

Large size valves adopts elastic gate plate Micro-elastic deformation gate makes sealing more secure plate.

Vacuum Breaker

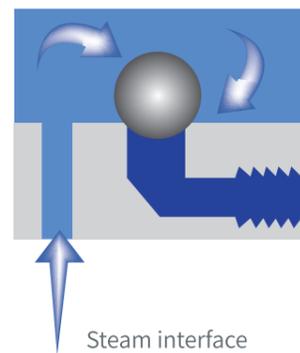

Vacuum Breaker

VMV vacuum breaker protect your equipment from vacuum damage and help to efficiently discharge condensate from pipelines and containers.

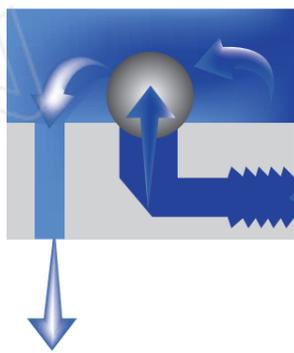

Working Principle

When working fine

The high and precision valve core valve seat adopt linear seal design. When the pipeline is under pressure, the valve seat and valve core is tightly closed, and there is no steam leakage.

When vacuum occurs

When the pressure of the steam system drops to normal pressure, the steam in the equipment cools down, and the valve core opens when a negative pressure is generated and a vacuum state occurs.

Air entering

※The differential pressure at which the valve opens is 4.6 mmHg

Technical Parameter

Working medium	steam, air	Max. allowable temperature	425°C
Nominal pressure	2.5MPa	Max. air intake	9000m ³ /h
Max. working pressure	2.1MPa	No load leak rate	0.1%
Max. pressure	0.01MPa	Connection method	RC

Application

This product is robust and reliable and can be used in a variety of systems and equipment to prevent vacuum, such as:

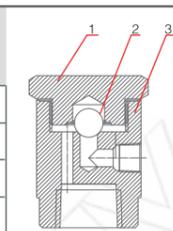

- Heat exchanger
- Steam storage tank
- Boiler
- Jacketed pot
- Sterilization room
- Steam main line

Advantage

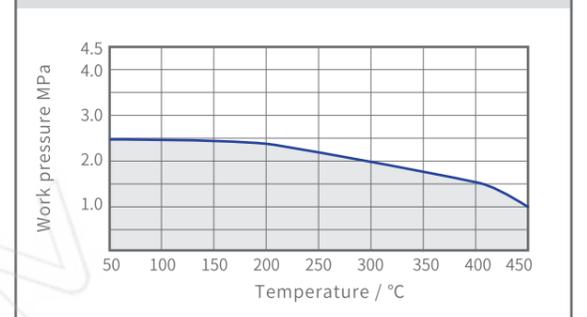

- Protects expensive equipment from vacuum damage
- Small size and sensitive action
- Simple, robust and reliable design
- VMV's domestic expert team technology, knowledge and service guarantee

Silencer

Mixer

DF3 Silencer

Mixer IM40M

Product Features

The DF3 silencer is compact and is used to discharge to the steam trap outlet of the inlet condensate return pipeline. It reduces the noise and water hammer problems caused by rapid cooling of flash condensate at the steam trap discharge outlet.

The main body of the silencer is made of SS304, the inner part is stainless steel, and a filter device is installed at the inlet.

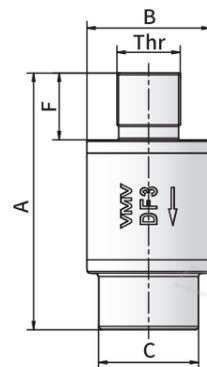

- Nominal pressure PN40;
- The maximum allowable temperature is 400°C;
- Maximum working pressure 3.2MPa;
- Maximum operating temperature 325°C
- The connection method is threaded Rc, BSP, NPT

CF8 Material PN25 Valve Body Pressure-Temperature Ratings

Mixers are used where steam is used to heat water or other fluids. When working, the highspeed jet of steam sucks and mixes the liquid from the annular hole, and then sprays the heated medium into the water tank. The steam and the medium are fully mixed to avoid the temperature stratification difference.

IN40M has external thread and butt welding type. When installing with higher flow rate, two or more injectors can be installed in parallel.

Structural Features

- All stainless steel 304 material
- No moving parts, compact design
- Noise and vibration can be minimized

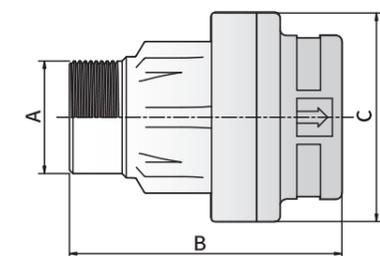

Installation Notes

- The mixer should be installed in the tank, preferably on the centerline, and injects steam horizontally.
- The piping can be inside or outside the tank.
- Steam piping must be well secured to protection against vibration and stress on tank walls.
- It is recommended to use a suitable adhesive on threaded joints.

Technical Standard

Newton Steam&Thermal Energy System

Water Separator

IN Single Mixer

Water Separator AS7

Features

Single mixers are used where steam is used to heat water or other fluids. When working, the highly sprayed steam inhales the liquid from the ring hole, mixes it, and then sprays the heated medium into the water tank. The steam and the medium are fully mixed to avoid the difference in temperature stratification. The single mixer has external thread and butt welding type, and two or more injectors can be installed in parallel when higher flow rates are required.

Structural Features

All stainless steel.
No moving parts, compact design.
Noise and vibration can be minimized.

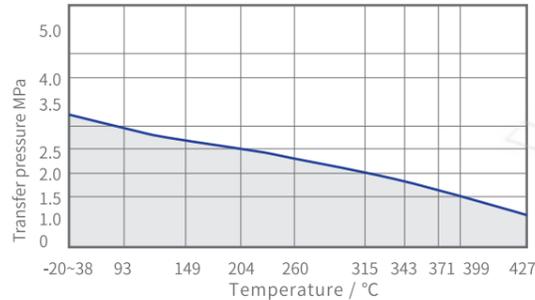

Occasion Applicable

Boilers feed water heating and deaeration of ideal water application and fluids' efficient steam heating, mixing and circulation.

Installation Precautions

The single mixer is installed at a lower position in the tank, preferably at the center line, spraying steam horizontally.
Pipes can be installed inside or outside the tank. Steam piping must be securely secured against vibration and stress on the tank walls.
It is recommended to use a suitable adhesive for threaded joints.

Working Principle

The product is a baffle type separator, which is used to separate steam, compressed air and other droplets contained in gas. It can improve the working performance of the separator when equipped with a thermal insulation jacket. The steam with a large amount of water enters the steam separator and moves in a centrifugal downward slope in it. The entrained water is separated due to the reduced speed. The separated liquid flows into the lower part and is discharged from the body through the steam trap, and the dry and clean steam is discharged from the outlet of the separator.

Structural Features

The DIN standard Y type strainer is a device used to eliminate particulate impurities in the medium, which can effectively protect the normal operation of valves and equipment on the pipeline. When cleaning is required, just take out the detachable strainer screen and reload it after processing, which is extremely convenient for maintenance. WCB cast steel material, double layer stainless steel strainer screen has more thorough filtration of impurities and better corrosion resistance. Optional drain plug for quick maintenance.

Sight Glass

S1 Sight Glass

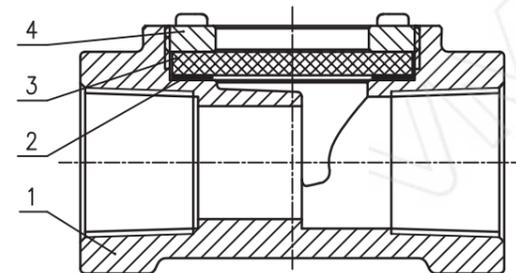

Technical Parameter

Model	Connection Method	Nominal Pressure DN	Working Pressure Range MPa	Condition Temperature °C / Pressure MPa
	Screw thread	5	0.05-0.35	148/0.35
S1	Screw thread	5	0.05-0.35	148/0.35
	Screw thread	5	0.05-0.35	148/0.35
	Screw thread	5	0.05-0.35	148/0.35

Material Table

Body: bronze, brass
 Gasket: Flexible Graphite
 Sight Window: high temperature quartz glass
 Bonnet: Bronze, Brass

Overview

Single window sight glass, threaded connection, available in different sizes in bronze and brass products.

Structural Features

1. The structure is compact, saving installation space to the greatest extent and meeting customer needs.
2. Provide customized threaded connections (BSP or NPT) to meet the individual needs of customers.
3. Temperature resistant calcified glass lens with explosion proof function.
4. Flexible graphite gasket with high sealing and erosion resistance.

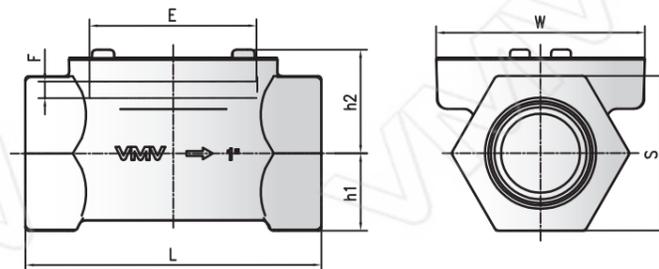

Applicable Scope

It is used for the flow and reaction of liquid, gas, steam and other media in the pipelines of petroleum, chemical, pharmaceutical, food and other industrial production equipment, and plays a role in monitoring production and avoiding accidents in the production process.

Warning

Condensate water in some applications can dissolve the sight glass, especially if the water contains corrosive alkaline and acidic substances. Therefore, it is recommended to check the sight glass regularly and replace the glass immediately if it becomes thinner. When viewing, wear goggles to protect your eyes.

Data Sheet

Structural Dimension Table

Model	Nominal Size	L	W	S	h1	h2	E	F	Weight
S1	DN10	89	63	31	16	29	51	5	0.55Kg
	DN15	89	63	31	16	29	51	5	0.55Kg
	DN20	89	63	37	19	32	51	5	0.65Kg
	DN25	90	63	47	24	33	51	5	0.8Kg

Condensate recovery system and steam energy-saving products

Condensate flash recovery system

Condensate flash system

P1	Primary steam pressure	bar	P	Power steam pressure	bar
P2	Flash steam pressure	bar	Pb	Back pressure	bar
Q1	Saturated condensate	kg/h			

Steam Ejector

Parameters that users need to provide

Noun	Definition	单位
Pp	Absolute pressure of working steam	Pa
tp	Temperature of working steam	°C
Vp	Specific volume of working steam	M ³ /kg
ip	Specific enthalpy of working steam	kJ/kg
PH	Absolute pressure of injected steam	Pa
TH	Temperature of injected steam	°C
VH	Specific volume of injected steam	M ³ /kg
iH	Specific enthalpy of injected steam	kJ/kg
GH	Flow rate of injected steam	kg/h
PC	Pressure after steam compression	Pa

Tube heat exchanger

Parameters that users need to provide

S	Heat Exchange Area	m ²	Q2	Secondary medium flow rate	kg/h
	Primary medium			Secondary medium	
Ps	Primary pressure	bar	T21	Initial temperature of secondary medium	°C
T1	Primary temperature	°C	T22	Secondary medium outlet temperature	°C
DN	Primary nominal diameter	DN		Secondary nominal diameter
